STRENGTHEN YOUR DATA'S SECURITY WITH SHIELD PLATFORM ENCRYPTION

Shield Platform Encryption gives your data a whole new layer of security while preserving critical platform functionality. It enables you to encrypt sensitive data at rest, and not just when transmitted over a network, so your company can confidently comply with privacy policies, regulatory requirements, and contractual obligations for handling private data.

Shield Platform Encryption builds on the data encryption options that Salesforce offers out of the box. Data stored in many standard and custom fields and in files and attachments is encrypted using an advanced HSM-based key derivation system, so it is protected even when other lines of defense have been compromised.

Your data encryption key is never saved or shared across organizations. Instead, it is derived on demand from a master secret and your organization-specific tenant secret, and cached on an application server.

You can try out Shield Platform Encryption at no charge in Developer Edition orgs. It is available in sandboxes after it has been provisioned for your production org.

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

IN THIS SECTION:

Encrypt Fields, Files, and Other Data Elements With Encryption Policy

You have a lot of flexibility in how to implement your encryption policy. Encrypt individual fields and apply different encryption schemes to those fields. Or choose to encrypt other data elements such as files and attachments, data in Chatter, or search indexes. Remember that encryption is not the same thing as field-level security or object-level security. Put those controls in place before you implement your encryption strategy.

Filter Encrypted Data with Deterministic Encryption

You can filter data that you have protected with Salesforce Shield Platform Encryption using deterministic encryption. Your users can filter records in reports and list views, even when the underlying fields are encrypted. Deterministic encryption supports WHERE clauses in SOQL queries and is compatible with unique and external ID fields. It also supports single-column indexes and single-column case-sensitive unique indexes. Shield Platform Encryption uses the Advanced Encryption Standard (AES) with 256-bit keys with CBC mode, and a static initialization vector (IV).

Manage Shield Platform Encryption

To provide Shield Platform Encryption for your organization, contact your Salesforce account executive. They'll help you provision the correct license so you can get started on creating your own unique tenant secret.

Encrypt Fields, Files, and Other Data Elements With Encryption Policy

You have a lot of flexibility in how to implement your encryption policy. Encrypt individual fields and apply different encryption schemes to those fields. Or choose to encrypt other data elements such as files and attachments, data in Chatter, or search indexes. Remember that encryption is not the same thing as field-level security or object-level security. Put those controls in place before you implement your encryption strategy.

IN THIS SECTION:

Encrypt New Data in Standard Fields

You can encrypt standard fields on standard objects from the Encryption policy page. For best results, encrypt the least amount of fields possible.

Encrypt Fields on Custom Objects and Custom Fields

You can encrypt standard fields on custom objects, and custom fields on both standard and custom objects, from the management settings for each object. For best results, encrypt the least amount of fields possible. When you add encryption to a field, all new data in that field is encrypted.

EDITIONS

Available as an add-on subscription in: **Enterprise**, **Performance**, and **Unlimited** Editions. Requires purchasing Salesforce Shield. Available in **Developer** Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

Encrypt New Files and Attachments

For another layer of data protection, encrypt files and attachments. If Shield Platform Encryption is on, the body of each file or attachment is encrypted when it's uploaded.

Get Statistics About Your Encryption Coverage

The Encryption Statistics page provides an overview of all your encrypted data. This information helps you to stay on top of your key rotation and management tasks. You can also use encryption statistics to identify which objects and fields you may want to update after you rotate your key material.

Synchronize Your Data Encryption with the Background Encryption Service

Periodically, you change your encryption policy. Or you rotate your keys. To get the most protection out of your encryption strategy, it's important to synchronize new and existing encrypted data under your most recent encryption policy and keys.

Fix Compatibility Problems

When you select fields or files to encrypt, Salesforce automatically checks for potential side effects and warns you if any existing settings may pose a risk to data access or your normal use of Salesforce. You have some options for how to clear up these problems.

Use Encrypted Data in Formulas

Use custom formula fields to quickly find encrypted data. You can write formulas with several operators and functions, render encrypted data in text, date, and date/time formats, and reference quick actions.

Apply Encryption to Fields Used in Matching Rules

Matching rules used in duplicate management help you maintain clean and accurate data. Apply deterministic encryption to the fields to make them compatible with standard and custom matching rules.

Encrypt Data in Chatter

Enabling Shield Platform Encryption for Chatter adds an extra layer of security to information that users share in Chatter. You can encrypt data at rest in feed posts and comments, questions and answers, link names and URLs, poll questions and choices, and content from your custom rich publisher apps.

Encrypt Search Index Files

Sometimes you need to search for personally identifiable information (PII) or data that's encrypted in the database. When you search your org, the results are stored in search index files. You can encrypt these search index files, adding another layer of security to your data.

Encrypt Einstein Analytics Data

To get started with Einstein Analytics Encryption, generate a tenant secret with Shield Platform Encryption. Once you generate an Analytics tenant secret, Einstein Analytics Encryption uses the Shield Platform Encryption key management architecture to encrypt your Einstein Analytics data.

Encrypt New Data in Standard Fields

You can encrypt standard fields on standard objects from the Encryption policy page. For best results, encrypt the least amount of fields possible.

Note: This page is about Shield Platform Encryption, not Classic Encryption. What's the difference?

Depending on the size of your org, enabling a standard field for encryption can take a few minutes.

- **1.** Make sure that your org has an active encryption key. If you're not sure, check with your administrator.
- 2. From Setup, in the Quick Find box, enter *Platform Encryption*, and then select **Encryption Policy**.
- 3. Click Encrypt Fields.
- 4. Click Edit.
- 5. Select the fields you want to encrypt.

 All new data entered in this field is encrypted. By default, data is encrypted using a probabilistic encryption scheme. To apply deterministic encryption to your data, select **Deterministic** from the Encryption Scheme list. For more information, see "How Deterministic Encryption Supports Filtering" in Salesforce Help.

6. Click Save.

The automatic Platform Encryption validation service checks for settings in your org that can block encryption. You receive an email with suggestions for fixing incompatible settings.

Field values are automatically encrypted only in records created or updated after you've enabled encryption. Contact Salesforce to update existing records so that their field values are encrypted.

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

Encrypt New Files and Attachments

Encrypt Fields on Custom Objects and Custom Fields

You can encrypt standard fields on custom objects, and custom fields on both standard and custom objects, from the management settings for each object. For best results, encrypt the least amount of fields possible. When you add encryption to a field, all new data in that field is encrypted.

IN THIS SECTION:

Encrypt New Data in Custom Fields in Salesforce Classic

Add encryption when you create a field in Salesforce Classic, or add encryption to new data entered in an existing custom field.

Encrypt New Data in Custom Fields in Lightning Experience

Add encryption when you create a new field in Lightning Experience, or add encryption to new data entered in an existing custom field.

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

USER PERMISSIONS

To view setup:

 View Setup and Configuration

To encrypt fields:

Encrypt New Data in Custom Fields in Salesforce Classic

Add encryption when you create a field in Salesforce Classic, or add encryption to new data entered in an existing custom field.

To apply deterministic encryption to custom fields, first enable deterministic encryption from the Platform Encryption Advanced Settings page in Setup.

- 1. From the management settings for the object, go to Fields.
- 2. In the Custom Fields & Relationships section, create a field or edit an existing one.

3. Select Encrypted.

All new data entered in this field is encrypted. By default, data is encrypted using a probabilistic encryption scheme. To apply deterministic encryption to your data, select a deterministic option listed under Encrypted.

4. Click Save.

The automatic Platform Encryption validation service checks for settings in your org that can block encryption. You receive an email with suggestions for fixing incompatible settings.

Field values are automatically encrypted only in records created or updated after you've enabled encryption. Contact Salesforce to encrypt existing data.

Note: This page is about Shield Platform Encryption, not Classic Encryption. What's the difference?

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

USER PERMISSIONS

To view setup:

 View Setup and Configuration

To encrypt fields:

Encrypt New Data in Custom Fields in Lightning Experience

Add encryption when you create a new field in Lightning Experience, or add encryption to new data entered in an existing custom field.

To apply deterministic encryption to custom fields, first enable deterministic encryption from the Platform Encryption Advanced Settings page in Setup.

- 1. From Setup, select **Object Manager**, and then select your object.
- 2. Click Fields & Relationships.
- 3. When you create or edit a custom field, select **Encrypted**.

 All new data entered in this field is encrypted. By default, data is encrypted using a probabilistic encryption scheme. To apply deterministic encryption to your data, select a deterministic option listed under Encrypted.

4. Click Save.

The automatic Platform Encryption validation service checks for settings in your org that can block encryption. You receive an email with suggestions for fixing incompatible settings.

Field values are automatically encrypted only in records created or updated after you've enabled encryption. Contact Salesforce to encrypt existing data.

Note: This page is about Shield Platform Encryption, not Classic Encryption. What's the difference?

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

USER PERMISSIONS

To view setup:

 View Setup and Configuration

To encrypt fields:

Encrypt New Files and Attachments

For another layer of data protection, encrypt files and attachments. If Shield Platform Encryption is on, the body of each file or attachment is encrypted when it's uploaded.

- Note: Before you begin, make sure that your organization has an active encryption key; if you're not sure, check with your administrator.
- 1. From Setup, in the Quick Find box, enter *Platform Encryption*, and then select **Encryption Policy**.
- 2. Select Encrypt Files and Attachments.
- 3. Click Save.
- (1) Important: Users with access to the file can work normally with it regardless of their encryption-specific permissions. Users who are logged in to your org and have read access can search and view the body content.

Users can continue to upload files and attachments per the usual file size limits. Expansion of file sizes caused by encryption doesn't count against these limits.

Turning on file and attachment encryption affects new files and attachments. It doesn't automatically encrypt files and attachments that were already in Salesforce. To encrypt existing files, contact Salesforce.

To check whether a file or attachment is encrypted, look for the encryption indicator on the detail page of the file or attachment. You can also query the isEncrypted field on the ContentVersion object (for files) or on the Attachment object (for attachments).

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

Get Statistics About Your Encryption Coverage

The Encryption Statistics page provides an overview of all your encrypted data. This information helps you to stay on top of your key rotation and management tasks. You can also use encryption statistics to identify which objects and fields you may want to update after you rotate your key material.

Available as an add-on subscription in: **Enterprise**, **Performance**, and **Unlimited** Editions. Requires purchasing Salesforce Shield. Available in **Developer** Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

IN THIS SECTION:

Gather Encryption Statistics

The Encryption Statistics page shows you how much of your data is encrypted by Shield Platform Encryption, and how much of that data is encrypted by an active tenant secret. Use this information to inform your key rotation actions and timelines. You can also use the Encryption Statistics page to collect information about the fields and objects you want to synchronize with the background encryption service.

Interpret and Use Encryption Statistics

The Encryption Statistics page offers a snapshot of your encrypted data. You can use the information on this page to help make informed decisions about managing your encrypted data.

Gather Encryption Statistics

The Encryption Statistics page shows you how much of your data is encrypted by Shield Platform Encryption, and how much of that data is encrypted by an active tenant secret. Use this information to inform your key rotation actions and timelines. You can also use the Encryption Statistics page to collect information about the fields and objects you want to synchronize with the background encryption service.

- 1. From Setup, in the Quick Find box, enter *Platform Encryption*, and then select **Encryption Statistics**.
- 2. Select an object type or custom object from the left pane. If you see a "--" in the Data Encrypted or Uses Active Key columns, you haven't gathered statistics for that object yet.

Object	Data Encrypted	Uses Active Key
Account /	22%	22%
Case	0%	0%
Case Comment		-)
Contact	31%	31%
<u>Lead</u>	57%	57%
Opportunity	0%	0%
Referral	76%	76%

- 3. Click Gather Statistics.
- 4. Refresh the page.

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

USER PERMISSIONS

To view Setup

 View Setup and Configuration The statistics show all available information about data for each object.

Note:

- The gathering process time varies depending on how much data you have in your object. You're notified by email when the gathering process is finished. You can gather statistics once every 24 hours.
- Feed Item doesn't display statistics because it's derived from Feed Post. Gathering statistics for Feed Post is sufficient to confirm the encryption status of both Feed Post and Feed Item.

Interpret and Use Encryption Statistics

The Encryption Statistics page offers a snapshot of your encrypted data. You can use the information on this page to help make informed decisions about managing your encrypted data.

Available as an add-on subscription in: **Enterprise**, **Performance**, and **Unlimited** Editions. Requires purchasing Salesforce Shield. Available in **Developer** Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

The page offers two views of your encrypted data: a summary view and a detail view.

Encryption Summary View

The summary shows all your objects and statistics about the data in those objects.

Object	Data Encrypted	Uses Active Key
Account /	22%	22%
<u>Case</u>	0%	0%
Case Comment		-)
Contact	31%	31%
<u>Lead</u>	57%	57%
Opportunity	0%	0%
Referral	76%	76%

- Object—Lists your standard and custom objects. Data about standard objects are aggregated for all standard objects of a given type. Data about custom objects are listed for each custom object.
- Data Encrypted—The total percentage of data in an object that's encrypted. In the example above, 22% of all data in Account objects in encrypted. The Case object shows 0%, meaning none of the data in any Case is encrypted.
- Uses Active Key—The percentage of your encrypted data in that object or object type that is encrypted with the active tenant secret.

When the numbers in both Data Encrypted and Uses Active Key columns are the same, all your encrypted data uses your active tenant secret. A double dash (--) means that statistics haven't been gathered for that object or object type yet.

Encryption Detail View

When you select an object, you see detailed statistics about the data stored in that object.

- Field—All encryptable standard and custom fields in that object that contain data.
- API Name—The API name for fields that contain data.

- Encrypted Records—The number of encrypted values stored in a field type across all objects of given type. For example, you select the Account object and see "9" in the Encrypted Records column next to Account Name. That means there are nine encrypted records across all Account Name fields.
- Unencrypted Records—The number of plaintext values stored in a field type.
- Mixed Tenant Secret Status—Indicates whether a mixture of active and archived tenant secrets apply to encrypted data in a field type.
- Mixed Schemes— Indicates whether a mixture of deterministic and probabilistic encryption schemes apply to encrypted data in a field type.
- Note: The following applies to both encrypted and unencrypted records:
 - The records count for a field doesn't include NULL or BLANK values. A field with NULL or BLANK values may show a different (smaller) records count than the actual number of records.
 - The records count for compound fields such as Contact.Name or Contact.Address may show a different (larger) records count than the actual number of records. The count includes the two or more fields that are counted for every record.

Usage Best Practices

Use these statistics to make informed decisions about your key management tasks.

- Update encryption policies—The encryption statistics detail view shows you which fields in an object contain encrypted data.

 Use this information to periodically evaluate whether your encryption policies match your organization's encryption strategy.
- Rotate keys—You may want to encrypt all your data with your active tenant secret. Review the encryption summary pane on
 the left side of the page. If the percentage in the Uses Active Key column is lower than the percentage in the Data Encrypted
 column, some of your data uses an archived tenant secret. To synchronize your data, Contact Salesforce Customer Support.
- Synchronize data—Key rotation is an important part of any encryption strategy. When you rotate your key material, you may
 want to apply the active key material to existing data. Review the Uses Active Key and Mixed Tenant Secret Status columns to
 identify any fields that include data encrypted with an archived key. Make a note of these objects and fields, then contact
 Salesforce Customer Support to request the background encryption job. Salesforce Customer Support can focus just on those
 objects and fields you need to synchronize, keeping the background encryption job as short as possible.

Synchronize Your Data Encryption with the Background Encryption Service

Periodically, you change your encryption policy. Or you rotate your keys. To get the most protection out of your encryption strategy, it's important to synchronize new and existing encrypted data under your most recent encryption policy and keys.

When change happens, Salesforce is here to help you synchronize your data. We can encrypt existing data in the background to ensure data alignment with the latest encryption policy and tenant secret.

When We Do and Don't Automatically Encrypt Your Data

- When you turn on encryption for specific fields or other data, newly created and edited data are automatically encrypted with the most recent key.
- Data that's already in your org doesn't automatically get encrypted. Our background encryption service takes care of that on request.
- When you change your tenant secret as part of your key rotation strategy, data that's already encrypted remains encrypted with the old tenant secret. Our background encryption service can update it on request. And don't worry, you always have access to your data as long as you don't destroy the old, archived keys.
- If you turn off encryption, data that's already there is automatically decrypted based on the relevant key. Any functionality impacted by having decrypted data is restored.

• If Salesforce support re-encrypts your data with a new key, any data that was encrypted with the destroyed key is skipped. To access data encrypted with a destroyed key, import a backup of the destroyed key.

Note: Synchronizing your data encryption does not affect the record timestamp. It doesn't execute triggers, validation rules, workflow rules, or any other automated service.

How to Request Background Encryption Service

Allow lead time

Contact Salesforce support 2–3 business days before you need the background encryption completed. The time to complete the process varies based on the volume of data. It could take several days. Salesforce Customer Support can run the background encryption service Monday through Friday between 6 AM and 5 PM Pacific Time.

Specify the objects and fields

Provide the list of objects and field names you want encrypted or re-encrypted.

Verify the list

Verify that this list matches the set of standard fields selected on the Encrypt Standard Fields page, and the custom fields you selected for encryption on the Field Definition page.

Tip: Also check that your field values aren't too long for encryption.

Include files and attachments?

Encryption for files and attachments is all or nothing. You don't have to specify which ones.

Include history and feed data?

Specify whether you want the corresponding field history and feed data encrypted.

Choose a time

Select your preferred off-peak maintenance window. We try to accommodate your needs.

Tip: If you're not sure which data is already encrypted, visit the Encryption Statistics page, which keeps a record of all fields that you have encrypted.

What If You Destroyed Your Key?

If your encryption key has been destroyed, your data can't be automatically decrypted. You have some options for handling this data.

- Reimport the destroyed key from a backup, then ask Salesforce Customer Support to synchronize your data with your encryption policy.
- Delete all the data that was encrypted with the destroyed key, then ask Salesforce Customer Support to synchronize your data.
- Ask Salesforce Customer Support to mass overwrite the data that was encrypted with the destroyed key with "?????".

Fix Compatibility Problems

When you select fields or files to encrypt, Salesforce automatically checks for potential side effects and warns you if any existing settings may pose a risk to data access or your normal use of Salesforce. You have some options for how to clear up these problems.

If your results include error messages, you're probably running into one or more of these limitations:

Portals

You can't encrypt standard fields, because a customer portal or a partner portal is enabled in your organization. To deactivate a customer portal, go to the Customer Portal Settings page in Setup. To deactivate a partner portal, go to the Partners page in Setup.

Note: Communities are not related to this issue. They are fully compatible with encryption.

Criteria-Based Sharing Rules

You've selected a field that is used in a filter in a criteria-based sharing rule.

SOQL/SOSL queries

You've selected a field that's used in an aggregate function in a SOQL query, or in a WHERE, GROUP BY, or ORDER BY clause.

Formula fields

You've selected a field that's referenced by a custom formula field in an unsupported way. Formulas can use BLANKVALUE, CASE, HYPERLINK, IF, IMAGE, ISBLANK, ISNULL, and NULLVALUE, as well as concatenation (&).

Flows and Processes

You've selected a field that's used in one of these contexts.

- To filter data in a flow
- To sort data in a flow
- To filter data in a process
- To filter data in a dynamic record choice
- To sort data in a dynamic record choice
- Note: By default, your results only list the first 250 errors per element. You can increase the number of errors listed in your results to 5000. Contact Salesforce for help.

SEE ALSO:

Encrypt New Data in Standard Fields

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

Use Encrypted Data in Formulas

Use custom formula fields to quickly find encrypted data. You can write formulas with several operators and functions, render encrypted data in text, date, and date/time formats, and reference quick actions.

Supported Operators, Functions, and Actions

Supported operators and functions:

- & and + (concatenate)
- BLANKVALUE
- CASE
- HYPERLINK
- IF
- IMAGE
- ISBLANK
- ISNULL
- NULLVALUE

Also supported:

- Spanning
- Quick actions

Formulas can return data only in text, date, or date/time formats.

CE

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

& And + (Concatenate)

This works:	(encryptedFieldc & encryptedFieldc)
Why it works:	This works because & is supported.
This doesn't work:	LOWER(encryptedFieldc & encryptedFieldc)
Why it doesn't work:	LOWER isn't a supported function, and the input is an encrypted value.

Case

CASE returns encrypted field values, but doesn't compare them.

This works:	CASE(custom_fieldc, "1", cf2c, cf3c))
	where either or both cf2c and cf3c are encrypted

Why it works:	custom_fieldc is compared to "1". If it is true, the formula returns cf2c because it's not comparing two encrypted values.
This doesn't work:	CASE("1", cf1c, cf2c, cf3c)
	where cf1_c is encrypted
Why it doesn't work:	You can't compare encrypted values.

ISBLANK and ISNULL

This works:	<pre>OR(ISBLANK(encryptedFieldc), ISNULL(encryptedFieldc))</pre>
Why it works:	Both ISBLANK and ISNULL are supported. OR works in this example because ISBLANK and ISNULL return a Boolean value, not an encrypted value.

Spanning

This works:

```
(LookupObject1__r.City & LookupObject1__r.Street) & (LookupObject2__r.City & LookupObject2__r.Street) & (LookupObject3__r.City & LookupObject3__r.Street) & (LookupObject4__r.City & LookupObject4__r.Street)
```

How and why you use it:

Spanning retrieves encrypted data from multiple entities. For example, let's say you work in the customer service department for Universal Containers. A customer has filed a case about a distribution problem, and you want to see the scope of the issue. You want all the shipping addresses related to this particular case. This example returns all the customers' shipping addresses as a single string in your case layout.

Validation

The encryption validation service checks your org to make sure that it's compatible with encrypted formula field types.

When you encrypt a given field, the validation service:

- Retrieves all formula fields that reference the field
- Verifies that the formula fields are compatible with encryption
- Verifies that the formula fields aren't used elsewhere for filtering or sorting

Limits

Up to 200 formula fields can reference a given encrypted custom field. A field that is referenced by more than 200 formula fields can't be encrypted. If you need to reference an encrypted custom field from more than 200 formula fields, contact Salesforce.

When you specify multiple fields to encrypt at one time, the 200-field limit is applied to the whole batch. If you know that you are encrypting fields that have multiple formula fields pointing to them, encrypt those fields one at a time.

Apply Encryption to Fields Used in Matching Rules

Matching rules used in duplicate management help you maintain clean and accurate data. Apply deterministic encryption to the fields to make them compatible with standard and custom matching rules.

Ask an administrator to enable **Deterministic Encryption** from the Platform Encryption Advanced Settings page. If you don't have a Data in Salesforce (Deterministic) type tenant secret, create one from the Platform Encryption Key Management page.

(1) Important: Matching rules used in duplicate management don't support probabilistically encrypted data.

Follow these steps to add encrypted fields to existing custom matching rules.

- 1. From Setup, in the Quick Find box, enter *Matching Rules*, and then select **Matching Rules**.
- 2. Deactivate the matching rule that reference fields you want to encrypt. If your matching rule is associated with an active duplicate rule, first deactivate the duplicate rule from the Duplicate Rules page. Then return to the Matching Rules page and deactivate the matching rule.
- **3.** From Setup, in the Quick Find box, enter *Platform Encryption*, and then select **Encryption Policy**.
- 4. Click Encrypt Fields.
- 5. Click Edit.
- **6.** Select the fields you want to encrypt, and select **Deterministic** from the Encryption Scheme list.

EDITIONS

Available as an add-on subscription in: **Enterprise**, **Performance**, and **Unlimited** Editions. Requires purchasing Salesforce Shield. Available in **Developer** Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

USER PERMISSIONS

To view setup:

 View Setup and Configuration

To enable encryption key (tenant secret) management:

 Manage Profiles and Permission Sets

7. Click Save.

8. After you get the email verifying encryption's been enabled on your fields, reactivate your matching rule and associated duplicate management rule.

Matching rules used in duplicate management now return exact and fuzzy matches on encrypted data.

Example: Let's say you recently encrypted Billing Address on your Contacts, and you want to add this field to a custom matching rule. First, deactivate the rule or rules you want to add this field to. Make sure that Billing Address is encrypted with the deterministic encryption scheme. Then add Billing Address to your custom matching rule, just like you would add any other field. Finally, reactivate your rule.

When you rotate your key material, you must update custom matching rules that reference encrypted fields. After you rotate your key material, deactivate and then reactivate the affected matching rules. Then contact Salesforce to request the background encryption process. When the background encryption process finishes, your matching rules can access all data encrypted with your active key material.

Important: To ensure accurate matching results, customers who used the beta version of this feature must deactivate any matching rules that reference encrypted fields and then reactivate them. If your custom matching rule fails on reactivation, contact Salesforce for help reactivating your match index.

Encrypt Data in Chatter

Enabling Shield Platform Encryption for Chatter adds an extra layer of security to information that users share in Chatter. You can encrypt data at rest in feed posts and comments, questions and answers, link names and URLs, poll questions and choices, and content from your custom rich publisher apps.

We recommend that you test Encryption for Chatter in a dedicated Sandbox environment before enabling it in production.

Unlike encryption for custom and standard fields, enabling encryption for Chatter encrypts all eligible Chatter fields.

- 1. Make sure that your org has an active encryption key. If you're not sure, check with your administrator.
- **2.** From Setup, in the Quick Find box, enter *Platform Encryption*, and then select **Encryption Policy**.

3. Click Encrypt Chatter.

The automatic Shield Platform Encryption validation service checks for settings that could block encryption. If the service finds potential problems, it sends you an email with suggestions for fixing the problems.

After you activate encryption for Chatter, new data that you enter into Chatter gets encrypted. To encrypt historic Chatter data, contact Salesforce Customer Support to request the background encryption service.

When you edit or update an encrypted Chatter field, the field's revision history is also encrypted. For example, if you update a post, the old version of the post remains encrypted.

If you enabled Encryption for Chatter in Spring '17 and you want to access the most up-to-date features, deselect **Encrypt Chatter** and then reselect **Encrypt Chatter**.

Note: This page is about Shield Platform Encryption, not Classic Encryption. What's the difference?

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

To encrypt fields:

Encrypt Search Index Files

Sometimes you need to search for personally identifiable information (PII) or data that's encrypted in the database. When you search your org, the results are stored in search index files. You can encrypt these search index files, adding another layer of security to your data.

- 1. From Setup, in the Quick Find box, enter *Platform Encryption*, and then select **Key Management**.
- 2. Select **Search Index** from the picklist.
- **3.** Select **Generate Tenant Secret**.

 This new tenant secret encrypts only the data stored in search index files.
- **4.** From Setup, in the Quick Find box, enter *Platform Encryption*, and then select **Encryption Policy**.
- **5.** Select **Encrypt Search Indexes**.

Your search indexes are now encrypted with the active Search Index tenant secret.

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

USER PERMISSIONS

To view setup:

 View Setup and Configuration

To enable encryption key (tenant secret) management:

 Manage Profiles and Permission Sets

Encrypt Einstein Analytics Data

To get started with Einstein Analytics Encryption, generate a tenant secret with Shield Platform Encryption. Once you generate an Analytics tenant secret, Einstein Analytics Encryption uses the Shield Platform Encryption key management architecture to encrypt your Einstein Analytics data.

- From Setup, in the Quick Find box, enter Platform Encryption, and then select Key Management.
- 2. Select Analytics from the picklist.
- **3.** Generate a tenant secret or upload key material.
- **4.** From Setup, in the Quick Find box, enter *Platform Encryption*, and then select **Encryption Policy**.
- 5. Select Encrypt Einstein Analytics.
- 6. Click Save.

New datasets in Einstein Analytics are now encrypted.

Note: Data that was in Einstein Analytics before encryption was enabled is not encrypted. If pre-existing data is imported from Salesforce objects through the dataflow, the data becomes encrypted on the next dataflow run. Other pre-existing data (such as CSV data) must be reimported to become encrypted. Although pre-existing data is not encrypted, it is still accessible and fully functional in its unencrypted state when encryption is enabled.

EDITIONS

Available as an add-on subscription in: **Enterprise**, **Performance**, and **Unlimited** Editions. Requires purchasing Einstein Analytics Platform and either Salesforce Shield or the Platform Encryption add-on.

Available in both Salesforce Classic and Lightning Experience.

USER PERMISSIONS

Manage Encryption Keys

Filter Encrypted Data with Deterministic Encryption

You can filter data that you have protected with Salesforce Shield Platform Encryption using deterministic encryption. Your users can filter records in reports and list views, even when the underlying fields are encrypted. Deterministic encryption supports WHERE clauses in SOQL queries and is compatible with unique and external ID fields. It also supports single-column indexes and single-column case-sensitive unique indexes. Shield Platform Encryption uses the Advanced Encryption Standard (AES) with 256-bit keys with CBC mode, and a static initialization vector (IV).

IN THIS SECTION:

How Deterministic Encryption Supports Filtering

By default, Salesforce encrypts data using a probabilistic encryption scheme. Each bit of data is turned into a fully random ciphertext string every time it's encrypted. Encryption doesn't generally impact users who are authorized to view the data. The exceptions are when logic is executed in the database or when encrypted values are compared to a string or to each other. In these cases, because the data has been turned into random, patternless strings, filtering isn't possible. For example, you might run a SOQL query in custom Apex code against the Contact object, where LastName = 'Smith'. If the LastName field is encrypted with probabilistic encryption, you can't run the query. Deterministic encryption addresses this problem.

Encrypt Data with the Deterministic Encryption Scheme

Enable the deterministic encryption scheme, then apply deterministic encryption to fields.

How Deterministic Encryption Supports Filtering

By default, Salesforce encrypts data using a probabilistic encryption scheme. Each bit of data is turned into a fully random ciphertext string every time it's encrypted. Encryption doesn't generally impact users who are authorized to view the data. The exceptions are when logic is executed in the database or when encrypted values are compared to a string or to each other. In these cases, because the data has been turned into random, patternless strings, filtering isn't possible. For example, you might run a SOQL query in custom Apex code against the Contact object, where LastName = 'Smith'. If the LastName field is encrypted with probabilistic encryption, you can't run the query. Deterministic encryption addresses this problem.

To be able to use filters when data is encrypted, we have to allow some patterns in our data. Deterministic encryption uses a static initialization vector (IV) so that encrypted data can be matched to a particular field value. The system can't read a piece of data that's encrypted, but it does know how to retrieve the ciphertext that stands for that piece of data thanks to the static IV. The IV is unique for a given field in a given org and can only be decrypted with your org-specific encryption key.

We evaluate the relative strengths and weaknesses of cryptographic approaches based on the types of attacks that can be launched against a particular algorithm. We also consider the length of time that it could take for the attack to succeed. For example, it is commonly said that a brute-force attack against an AES 256-bit key would take a billion billion years given current computing capabilities. Nevertheless, it is common practice to rotate keys regularly.

Certain kinds of attacks become a bit less far-fetched when you get away from purely random ciphertext. For example, an attacker could conceivably analyze deterministically encrypted ciphertext and determine that the cleartext string Alice always resolves to the ciphertext YjnkY2Jlnju5M2JkNjk4MGJinwE2nGQ5nzI5MzU1OTcnCg==. Given enough time to eavesdrop, an attacker could defeat encryption by building a dictionary of cleartext values to ciphertext values.

The Salesforce Shield approach is to expose just enough determinism to enable bona fide users to filter on encrypted data while limiting it enough to ensure that a given plaintext value does not universally result in the same ciphertext value across all fields, objects, or orgs. Even if an attacker successfully matched cleartext to encrypted values for one field, the attacker would have to do it all over again for any other field, and again for the same field in another object.

In this way, deterministic encryption only decreases encryption strength as minimally necessary to allow filtering.

Encrypt Data with the Deterministic Encryption Scheme

Enable the deterministic encryption scheme, then apply deterministic encryption to fields.

- Important: To filter and execute queries on fields with unique attributes, synchronize new and existing encrypted data by the active Data in Salesforce (Deterministic) key material. See Synchronize Your Data Encryption with the Background Encryption Service for tips on timing and placing your background encryption service request.
- From Setup, in the Quick Find box, enter Platform Encryption, and then select Key Management.
- **2.** From the Choose Tenant Secret Type menu, select **Data in Salesforce**.
- 3. Generate or upload a tenant secret.
- **4.** From Setup, in the Quick Find box, enter *Platform Encryption*, and then select **Advanced Settings**.
- 5. Enable **Deterministic Encryption**.
- **6.** From Setup, select **Key Management**.
- **7.** Select the **Data in Salesforce (Deterministic)** secret type.
- **8.** Generate a tenant secret.

You can mix and match probabilistic and deterministic encryption, encrypting some fields one way and some fields the other.

USER PERMISSIONS

Generate, destroy, export, import, and upload tenant secrets and customer-supplied key material:

Manage Encryption Keys

Enable features on the Advanced Settings page

 Customize Application AND

Modify All Data

- **9.** Enable encryption for each field, specifying the deterministic encryption scheme. How you do that depends on whether it's a standard field or a custom field.
 - For standard fields, from Setup, select **Encryption Policy**, and then select **Encrypt Fields**. For each field you want to encrypt, select the field name, and then choose **Deterministic** from the Encryption Scheme list.

• For custom fields, open the Object Manager and edit the field you want to encrypt. Select **Encrypt the contents of this field**, and select **Use case sensitive deterministic encryption**.

10. To encrypt your existing data with the active Data in Salesforce (Deterministic) key material, contact Salesforce Support. If you change the encryption scheme for a field from Deterministic to Probabilistic, contact Salesforce to re-encrypt data in that field with your active Data in Salesforce key material.

Manage Shield Platform Encryption

To provide Shield Platform Encryption for your organization, contact your Salesforce account executive. They'll help you provision the correct license so you can get started on creating your own unique tenant secret.

Assign the Manage Encryption Keys, Manage Certificates, and Customize Application permissions to people you trust to manage tenant secrets and certificates. Users with the Manage Encryption Keys permission can generate, export, import, and destroy organization-specific keys. It's a good idea to monitor the key management activities of these users regularly with the setup audit trail.

Users with both Manage Certificates and Manage Encryption Keys permissions can manage certificates and tenant secrets with the Shield Platform Encryption Bring Your Own Key (BYOK) service. You can also monitor these users' key and certificate management activities with the setup audit trail.

Authorized developers can generate, rotate, export, destroy, and reimport tenant secrets by coding a call to the TenantSecret object in the Salesforce API.

IN THIS SECTION:

Generate a Tenant Secret

You can have Salesforce generate a unique tenant secret for your organization, or you can generate your own tenant secret using your own external resources. In either case, you manage your own tenant secret: you can rotate it, archive it, and designate other users to share responsibility for it.

EDITIONS

Available as an add-on subscription in: **Enterprise**, **Performance**, and **Unlimited** Editions. Requires purchasing Salesforce Shield. Available in **Developer** Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

USER PERMISSIONS

To manage tenant secrets:

Manage Encryption Keys

Rotate Your Encryption Tenant Secrets

You control the life cycle of your data encryption keys by controlling the life cycle of your tenant secrets. It's recommended to regularly generate a new tenant secret and archive the previously active one.

Back Up Your Tenant Secret

Your tenant secret is unique to your organization and to the specific data to which it applies. Salesforce recommends that you export your secret to ensure continued data access in cases where you need to gain access to the related data again.

Destroy A Tenant Secret

Only destroy tenant secrets in extreme cases where access to related data is no longer needed. Your tenant secret is unique to your organization and to the specific data to which it applies. Once you destroy a tenant secret, related data is not accessible unless you previously exported the key and then import the key back into Salesforce.

Disable Encryption on Fields

At some point, you may need to disable Shield Platform Encryption for fields, files, or both. You can turn field encryption on or off individually, but file encryption is all or nothing.

Require Two-Factor Authentication for Key Management

Two-factor authentication is a powerful tool for securing access to data and resources. You can require two-factor authentication for key management tasks like generating, rotating, or uploading key material and certificates.

How Shield Platform Encryption Works

Shield Platform Encryption relies on a unique tenant secret that you control and a master secret that's maintained by Salesforce. We combine these secrets to create your unique data encryption key. We use that key to encrypt data that your users put into Salesforce, and to decrypt data when your authorized users need it.

Shield Platform Encryption Best Practices

Take the time to identify the most likely threats to your organization. This process helps you distinguish data that needs encryption from data that doesn't, so that you can encrypt only what you need to. Make sure that your tenant secret and keys are backed up, and be careful who you allow to manage your secrets and keys.

Tradeoffs and Limitations of Shield Platform Encryption

A security solution as powerful as Shield Platform Encryption doesn't come without some tradeoffs. When your data is encrypted, some users may see limitations to some functionality, and a few features aren't available at all. Consider the impact on your users and your overall business solution as you design your encryption strategy.

SEE ALSO:

Which User Permissions Does Shield Platform Encryption Require? The TenantSecret Object

Generate a Tenant Secret

You can have Salesforce generate a unique tenant secret for your organization, or you can generate your own tenant secret using your own external resources. In either case, you manage your own tenant secret: you can rotate it, archive it, and designate other users to share responsibility for it.

When you generate a new tenant secret, any new data is encrypted using this key. However, existing sensitive data remains encrypted using previous keys. In this situation, we strongly recommend re-encrypting these fields using the latest key. Contact Salesforce for help with this.

Note: This page is about Shield Platform Encryption, not Classic Encryption. What's the difference?

IN THIS SECTION:

Generate a Tenant Secret with Salesforce

Salesforce makes it easy to generate a unique tenant secret from the Setup menu.

Manage Tenant Secrets by Type

Tenant secret types allow you to specify which kind of data you want to encrypt with a tenant secret. You can apply different key rotation cycles or key destruction policies to tenant secrets that encrypt different kinds of data. You can apply a tenant secret to search index files or other data stored in tenant secret.

Generate Your Own Tenant Secret (BYOK)

When you supply your own tenant secret, you get the benefits of built-in Salesforce Shield
Platform Encryption plus the extra assurance that comes from exclusively managing your tenant secret.

Permission Sets

Profiles

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

USER PERMISSIONS

To manage tenant secrets:

Manage Encryption Keys

Generate a Tenant Secret with Salesforce

Salesforce makes it easy to generate a unique tenant secret from the Setup menu.

Only authorized users can generate tenant secrets from the Platform Encryption page. Ask your Salesforce admin to assign you the Manage Encryption Keys permission.

- 1. From Setup, in the Quick Find box, enter *Platform Encryption*, and then select **Key Management**.
- 2. In the Choose Tenant Secret Type dropdown list, choose a data type.
- 3. Click Generate Tenant Secret.

How often you can generate a tenant secret depends on the tenant secret type.

- You can generate tenant secrets for the Data in Salesforce type once every 24 hours in production orgs, and once every 4 hours in Sandbox orgs.
- You can generate tenant secrets for the Search Index type once every 7 days.

If you run into this limit, destroy an existing key before reactivating, rearchiving, or creating a callout to another one. Before destroying a key, synchronize the data it encrypts with an active key.

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

USER PERMISSIONS

To manage tenant secrets:

Manage Encryption Keys

Note: This page is about Shield Platform Encryption, not Classic Encryption. What's the difference?

Manage Tenant Secrets by Type

Tenant secret types allow you to specify which kind of data you want to encrypt with a tenant secret. You can apply different key rotation cycles or key destruction policies to tenant secrets that encrypt different kinds of data. You can apply a tenant secret to search index files or other data stored in tenant secret.

Tenant secrets are categorized according to the kind of data they encrypt.

Data in Salesforce

Encrypts data using the probabilistic encryption scheme, including data in fields, attachments, and files other than search index files.

Data in Salesforce (Deterministic)

Encrypts data using the deterministic encryption scheme, including data in fields, attachments, and files other than search index files.

Search Index

Encrypts search index files.

Analytics

Encrypts Einstein Analytics data.

Event Bus (Developer Preview)

Encrypts data changes and the corresponding change event that contains them.

Note:

- Tenant secrets that were generated or uploaded before the Spring '17 release are categorized as the Data in Salesforce type.
- You can have up to 50 active and archived tenant secrets of each type. For example, you
 can have one active and 49 archived Data in Salesforce tenant secrets, and the same
 number of Analytics tenant secrets. This limit includes Salesforce-generated and
 customer-supplied key material.

If you run into this limit, destroy an existing key before reactivating, rearchiving, or creating a callout to another one. Before destroying a key, synchronize the data it encrypts with an active key.

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

USER PERMISSIONS

To manage tenant secrets:

Manage Certificates

AND

Manage Encryption Keys

- 1. From Setup, in the Quick Find box, enter Platform Encryption, and then select **Key Management**.
- 2. In the Choose Tenant Secret Type dropdown list, choose a data type.

The Key Management page displays all tenant secrets of each data type. If you generate or upload a tenant secret while viewing tenant secrets of a particular type, it becomes the active tenant secret for that data.

Note: This page is about Shield Platform Encryption, not Classic Encryption. What's the difference?

Generate Your Own Tenant Secret (BYOK)

When you supply your own tenant secret, you get the benefits of built-in Salesforce Shield Platform Encryption plus the extra assurance that comes from exclusively managing your tenant secret.

Controlling your own tenant secret entails generating a BYOK-compatible certificate, using that certificate to encrypt and secure your self-generated tenant secret, then granting the Salesforce Shield Platform Encryption key management machinery access to your tenant secret.

IN THIS SECTION:

1. Generate a BYOK-Compatible Certificate

To encrypt customer-supplied key material, use Salesforce to generate a 4096-bit RSA certificate. You can generate a self-signed or certificate-authority (CA) signed certificate. Each BYOK-compatible certificate's private key is encrypted with a derived, org-specific tenant secret key.

2. Generate and Wrap Your Tenant Secret

Generate a random number as your tenant secret. Then calculate an SHA256 hash of the secret, and encrypt it with the public key from the certificate you generated.

3. Upload Your Tenant Secret

After you have your tenant secret, upload it to Salesforce. The Shield Key Management Service (KMS) uses your tenant secret to derive your org-specific data encryption key.

4. Opt-Out of Key Derivation with BYOK

If you don't want Salesforce to derive a data encryption key for you, you can opt out of key derivation and upload your own final data encryption key. Opting out gives you even more control of the key material used to encrypt and decrypt your data.

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

USER PERMISSIONS

To manage tenant secrets:

 Manage Encryption Keys AND

Manage Certificates

Generate a BYOK-Compatible Certificate

To encrypt customer-supplied key material, use Salesforce to generate a 4096-bit RSA certificate. You can generate a self-signed or certificate-authority (CA) signed certificate. Each BYOK-compatible certificate's private key is encrypted with a derived, org-specific tenant secret key.

To create a self-signed certificate:

- From Setup, in the Quick Find box, enter Platform Encryption, and then select Key Management.
- 2. Click Bring Your Own Key.
- 3. Click Create Self-Signed Certificate.
- **4.** Enter a unique name for your certificate in the Label field. The Unique Name field automatically assigns a name based on what you enter in the Label field.

The Exportable Private Key (1), Key Size (2), and Use Platform Encryption (3) settings are pre-set. These settings ensure that your self-signed certificate is compatible with Salesforce Shield Platform Encryption.

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

USER PERMISSIONS

To manage BYOK key material and certificates:

 Manage Encryption Keys AND
 Manage Certificates

5. When the Certificate and Key Detail page appears, click **Download Certificate**.

If you're not sure whether a self-signed or CA-signed certificate is right for you, consult your organization's security policy. See Certificates and Keys in Salesforce Help for more about what each option implies.

To create a CA-signed certificate, follow the instructions in the Generate a Certificate Signed By a Certificate Authority topic in Salesforce Help. Remember to manually change the **Exportable Private Key**, **Key Size**, and **Platform Encryption** settings to ensure that your certificate is BYOK-compatible.

Generate and Wrap Your Tenant Secret

Generate a random number as your tenant secret. Then calculate an SHA256 hash of the secret, and encrypt it with the public key from the certificate you generated.

1. Generate a 256-bit tenant secret using the method of your choice.

You can generate your tenant secret in one of 2 ways:

- Use your own on-premises resources to generate a tenant secret programmatically, using an open source library such as Bouncy Castle or OpenSSL.
 - Tip: We've provided a script on page 36 that may be useful as a guide to the process.
- Use a key brokering partner that can generate, secure, and share access to your tenant secret.
- Wrap your tenant secret with the public key from the BYOK-compatible certificate you generated. Specify the OAEP padding scheme. Make sure the resulting encrypted tenant secret and hashed tenant secret files are encoded using base64.
- **3.** Encode this encrypted tenant secret to base64.
- **4.** Calculate an SHA-256 hash of the plaintext tenant secret.
- **5.** Encode the SHA-256 hash of the plaintext tenant secret to base64.

EDITIONS

Available as an add-on subscription in: **Enterprise**, **Performance**, and **Unlimited** Editions. Requires purchasing Salesforce Shield. Available in **Developer** Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

USER PERMISSIONS

To manage tenant secrets:

 Manage Encryption Keys AND
 Manage Certificates

Upload Your Tenant Secret

After you have your tenant secret, upload it to Salesforce. The Shield Key Management Service (KMS) uses your tenant secret to derive your org-specific data encryption key.

- From Setup, in the Quick Find box, enter Platform Encryption, and then select Key Management.
- 2. Click Bring Your Own Key.
- **3.** In the Upload Tenant Secret section, attach both the encrypted key material and the hashed plaintext key material. Click **Upload**.

This tenant secret automatically becomes the active tenant secret.

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

USER PERMISSIONS

To manage key material:

 Manage Encryption Keys AND
 Manage Certificates Your tenant secret is now ready to be used for key derivation. From here on, the Shield KMS uses your tenant secret to derive an org-specific data encryption key. The app server then uses this key to encrypt and decrypt your users' data.

If you don't want Salesforce to derive a data encryption key for you, you can opt out of key derivation and upload your own final data encryption key. For more information, see "Opt-Out of Key Derivation with BYOK" in Salesforce Help.

Note: You can have up to 50 active and archived tenant secrets of each type. For example, you can have one active and 49 archived Data in Salesforce tenant secrets, and the same number of Analytics tenant secrets. This limit includes Salesforce-generated and customer-supplied key material.

If you reach the limit, destroy an existing key before reactivating, rearchiving, or creating a callout to another one. Before destroying a key, synchronize the data that it encrypts with an active key.

- **4.** Export your tenant secret, and back it up as prescribed in your organization's security policy.

 To restore a destroyed tenant secret, reimport it. The exported tenant secret is different from the tenant secret you uploaded. It's encrypted with a different key and has additional metadata embedded in it. See Back Up Your Tenant Secret in Salesforce Help.
- Note: This page is about Shield Platform Encryption, not Classic Encryption. What's the difference?

Opt-Out of Key Derivation with BYOK

If you don't want Salesforce to derive a data encryption key for you, you can opt out of key derivation and upload your own final data encryption key. Opting out gives you even more control of the key material used to encrypt and decrypt your data.

Generate your customer-supplied data encryption key using a method of your choice. Then calculate an SHA256 hash of the key, and encrypt it with the public key from a BYOK-compatible certificate. See Upload Your Tenant Secret for details about how to prepare customer-supplied key material.

- 1. From Setup, in the Quick Find box, enter *Platform Encryption*, and then select **Advanced Settings**.
- **2.** Enable Allow BYOK to Opt-Out of Key Derivation. You can now opt out of key derivation when you upload key material.
- 3. From Setup, in the Quick Find box, enter *Platform Encryption*, and then select **Key Management**.
- 4. Click Bring Your Own Key.
- 5. Uncheck Use Salesforce key derivation.

- **6.** In the Upload Tenant Secret section, attach both your encrypted data encryption key and your hashed plaintext data encryption key.
- 7. Click Upload.

This data encryption key automatically becomes the active key.

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

USER PERMISSIONS

Generate, destroy, export, import, and upload tenant secrets and customer-supplied key material:

Manage Encryption Keys

Enable features on the Advanced Settings page

 Customize Application AND Modify All Data

From now on, the Shield Key Management Service (KMS) skips the derivation process and uses your data encryption key to directly encrypt and decrypt your data. You can review the derivation status of all key material on the Key Management page.

8. Export your data encryption key and back it up as prescribed in your organization's security policy.

To restore your data encryption key, reimport it. The exported data encryption key is different from the data encryption key you uploaded. It is encrypted with a different key and has additional metadata embedded in it. See Back Up Your Tenant Secret in Salesforce Help.

Note: This page is about Shield Platform Encryption, not Classic Encryption. What's the difference?

Rotate Your Encryption Tenant Secrets

You control the life cycle of your data encryption keys by controlling the life cycle of your tenant secrets. It's recommended to regularly generate a new tenant secret and archive the previously active one.

Consult your organization's security policies to decide how often to rotate your tenant secrets. You can rotate a tenant secret once every 24 hours in production orgs and every 4 hours in sandbox environments.

The key derivation function uses a master secret, which is rotated with each major Salesforce release. Master secret rotation doesn't impact your encryption keys or your encrypted data until you rotate your tenant secret.

- From Setup, in the Quick Find box, enter Platform Encryption, and then select Key Management.
- 2. From the Choose Tenant Secret Type dropdown, choose a data type.
- **3.** Check the status of the data type's tenant secrets. Existing tenant secrets are listed as active, archived, or destroyed.

ACTIVE

Can be used to encrypt and decrypt new or existing data.

ARCHIVED

Can't encrypt new data. Can be used to decrypt data previously encrypted with this key when it was active.

DESTROYED

Can't encrypt or decrypt data. Data encrypted with this key when it was active can no longer be decrypted. Files and attachments encrypted with this key can no longer be downloaded.

4. Click **Generate New Tenant Secret** or **Bring Your Own Key**. If uploading a customer-supplied tenant secret, upload your encrypted tenant secret and tenant secret hash.

EDITIONS

Available as an add-on subscription in: **Enterprise**, **Performance**, and **Unlimited** Editions. Requires purchasing Salesforce Shield. Available in **Developer** Edition at no charge for orgs created in

Available in both Salesforce Classic and Lightning Experience.

USER PERMISSIONS

Summer '15 and later.

To manage tenant secrets:

Manage Encryption Keys

Note: You can have up to 50 active and archived tenant secrets of each type. For example, you can have one active and 49 archived Data in Salesforce tenant secrets, and the same number of Analytics tenant secrets. This limit includes Salesforce-generated and customer-supplied key material.

If you run into this limit, destroy an existing key before reactivating, rearchiving, or creating a callout to another one. Before destroying a key, synchronize the data it encrypts with an active key.

- **5.** If you want to re-encrypt field values with your active key material, contact Salesforce Customer Support. We'll help you encrypt existing data in the background to ensure data alignment with your latest encryption policy and key material configuration.
 - Warning: For clean and consistent results, we recommend that you contact Salesforce Customer Support for help reencrypting your data. You can apply your active key material to existing records by editing them through Setup, or programmatically through the API. Editing a record triggers the encryption service to encrypt the existing data again using the newest key material. This update changes the record's timestamp, and the update is recorded in the field history or Feed History. However, the field history in the History related list and Feed History aren't reencrypted with the new key material.

Note: This page is about Shield Platform Encryption, not Classic Encryption. What's the difference?

Back Up Your Tenant Secret

Your tenant secret is unique to your organization and to the specific data to which it applies. Salesforce recommends that you export your secret to ensure continued data access in cases where you need to gain access to the related data again.

- 1. In Setup, use the Quick Find box to find the Platform Encryption setup page.
- 2. In the table that lists your keys, find the tenant secret you want and click **Export**.
- 3. Confirm your choice in the warning box, then save your exported file.
 The file name is tenant-secret-org-<organization ID>-ver-<tenant secret version numer>.txt. For example, tenant-secret-org-00DD00000007eTR-ver-1.txt.
- **4.** Note the specific version you're exporting, and give the exported file a meaningful name. Store the file in a safe location in case you need to import it back into your organization.
 - Note: Your exported tenant secret is itself encrypted.
- **5.** To import your tenant secret again, click **Import** > **Choose File** and select your file. Make sure you're importing the correct version of the tenant secret.
- Note: This page is about Shield Platform Encryption, not Classic Encryption. What's the difference?

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

USER PERMISSIONS

To manage tenant secrets:

Manage Encryption Keys

Destroy A Tenant Secret

Only destroy tenant secrets in extreme cases where access to related data is no longer needed. Your tenant secret is unique to your organization and to the specific data to which it applies. Once you destroy a tenant secret, related data is not accessible unless you previously exported the key and then import the key back into Salesforce.

You are solely responsible for making sure your data and tenant secrets are backed up and stored in a safe place. Salesforce can't help you with deleted, destroyed, or misplaced tenant secrets.

- 1. In Setup, use the Quick Find box to find the Platform Encryption setup page.
- **2.** In the table that lists your tenant secrets, go to the row that contains the one you want to destroy and click **Destroy**.
- **3.** A warning box appears. Type in the text as shown and select the checkbox acknowledging that you're destroying a tenant secret, then click **Destroy**.

File previews and content that was already cached in the user's browser may still be visible in cleartext after you destroy the key that encrypted that content, until the user logs in again.

If you create a sandbox organization from your production organization and then destroy the tenant secret in your sandbox organization, the tenant secret still exists in the production organization.

Note: This page is about Shield Platform Encryption, not Classic Encryption. What's the difference?

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

USER PERMISSIONS

To manage tenant secrets:

Manage Encryption Keys

Disable Encryption on Fields

At some point, you may need to disable Shield Platform Encryption for fields, files, or both. You can turn field encryption on or off individually, but file encryption is all or nothing.

When you turn off Shield Platform Encryption for a field, most encrypted data is automatically mass-decrypted. The decryption starts automatically after you disable encryption for specific fields and save your changes. When data is decrypted, any functionality that was limited or unavailable when the data was encrypted is also restored. Salesforce notifies you by email when the decryption process is complete.

Long text area and rich text area field types can't be automatically decrypted. If you decrypt data encrypted with a destroyed key, that data can't be mass-decrypted.

Note: If you disable Shield Platform Encryption and can't access data in fields that were previously encrypted, contact Salesforce for help.

- 1. From Setup, in the Quick Find box, enter *Platform Encryption*, and then select **Encryption Policy**.
- 2. Click Encrypt Fields, then click Edit.
- **3.** Deselect the fields you want to stop encrypting, then click **Save**. Users can see data in these fields.
- **4.** To disable encryption for files or Chatter, deselect those features from the **Encryption Policy** page and click **Save**.

The functionality that was limited or changed by Platform Encryption is restored for your data after it's decrypted.

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

To disable encryption:

Require Two-Factor Authentication for Key Management

Two-factor authentication is a powerful tool for securing access to data and resources. You can require two-factor authentication for key management tasks like generating, rotating, or uploading key material and certificates.

(1) Important: Make sure that you provide security administrators a way to get a time-based, one-time password. This password is their second authentication factor. Otherwise, they can't

complete encryption key-related tasks.

- 1. From Setup, in the Quick Find box, enter *Identity Verification*, and then select **Identity Verification**.
- **2.** Select **Raise session to high-assurance** from the Manage Encryption Keys dropdown. All admins with the Manage Encryption Keys permission must use a second form of authentication to complete key management tasks through Setup and the API.

EDITIONS

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

USER PERMISSIONS

To assign identity verification for key management tasks:

Manage Encryption Keys

How Shield Platform Encryption Works

Shield Platform Encryption relies on a unique tenant secret that you control and a master secret that's maintained by Salesforce. We combine these secrets to create your unique data encryption key. We use that key to encrypt data that your users put into Salesforce, and to decrypt data when your authorized users need it.

Encrypting files, fields, and attachments has no effect on your organization's storage limits.

Note: This page is about Shield Platform Encryption, not Classic Encryption. What's the difference?

IN THIS SECTION:

Can I Bring My Own Encryption Key?

Yes. You can generate and store your customer-supplied key material outside of Salesforce using your own crypto libraries, enterprise key management system, or hardware security module (HSM). You then grant the Salesforce Shield Platform Encryption key management machinery access to those keys. You can choose to encrypt your keys with a public key from a self-signed or CA-signed certificate.

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

Which Standard Fields and Data Elements Can I Encrypt?

You can encrypt certain fields on standard and custom objects, data in Chatter, and search index files. With some exceptions, encrypted fields work normally throughout the Salesforce user interface, business processes, and APIs.

Which Custom Fields Can I Encrypt?

You can encrypt the contents of fields that belong to one of these custom field types, on either standard or custom objects.

Which Files Are Encrypted?

When you enable Shield Platform Encryption for files and attachments, all files and attachments that can be encrypted are encrypted. The body of each file or attachment is encrypted when it's uploaded.

Which User Permissions Does Shield Platform Encryption Require?

Assign permissions to your users according to their roles regarding encryption and key management. Some users need permission to select data for encryption, while other users require combinations of permissions to work with certificates or key material. Enable these permissions for user profiles just like you would any other user permission.

Why Isn't My Encrypted Data Masked?

If the encryption service isn't available, data is masked in some types of encrypted fields. This is to help you troubleshoot encryption key issues, not to control user access to data. If you have data that you don't want some users to see, revisit those users' field-level security settings, record access settings, and object permissions.

Behind the Scenes: The Shield Platform Encryption Process

When users submit data, the application server looks for the org-specific data encryption key in its cache. If it isn't there, the application server gets the encrypted tenant secret from the database and asks the key derivation server to derive the key. The encryption service then encrypts the data on the application server.

Behind the Scenes: The Search Index Encryption Process

The Salesforce search engine is built on the open-source enterprise search platform software Apache Solr. The search index, which stores tokens of record data with links back to the original records stored in the database, is housed within Solr. Partitions divide the search index into segments to allow Salesforce to scale operations. Apache Lucene is used for its core library.

How Do I Deploy Shield Platform Encryption?

When you deploy Shield Platform Encryption to your org with a tool such as Force.com IDE, Migration Tool, or Workbench, the Encrypted field attribute persists. However, if you deploy to orgs with different encryption settings, the effect depends on whether Shield Platform Encryption is enabled in the target org.

How Does Shield Platform Encryption Work In a Sandbox?

Refreshing a sandbox from a production organization creates an exact copy of the production organization. If Shield Platform Encryption is enabled on the production organization, all encryption settings are copied, including tenant secrets created in production.

Shield Platform Encryption Terminology

Encryption has its own specialized vocabulary. To get the most out of your Shield Platform Encryption features, it's a good idea to familiarize yourself with the key terms, such as hardware security module, key rotation, and master secret.

What's the Difference Between Classic Encryption and Shield Platform Encryption?

With Shield Platform Encryption, you can encrypt a variety of widely used standard fields, along with some custom fields and many kinds of files. Shield Platform Encryption also supports person accounts, cases, search, approval processes, and other key Salesforce features. Classic encryption lets you protect only a special type of custom text field, which you create for that purpose.

Can I Bring My Own Encryption Key?

Yes. You can generate and store your customer-supplied key material outside of Salesforce using your own crypto libraries, enterprise key management system, or hardware security module (HSM). You then grant the Salesforce Shield Platform Encryption key management machinery access to those keys. You can choose to encrypt your keys with a public key from a self-signed or CA-signed certificate.

To work with our key management machinery, your customer-supplied key material needs to meet these specifications:

- 256-bit size
- Encrypted with a public RSA key that is extracted from the downloaded BYOK certificate, then padded using OAEP padding
- Once it's encrypted, it must be encoded in standard base64

To work with encryption keys, you'll need the Manage Encryption Keys permission. To generate BYOK-compatible certificates, you'll need the Customize Application permission.

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

IN THIS SECTION:

Why Bring Your Own Key?

Bring Your Own Key (BYOK) gives you an extra layer of protection in the event of unauthorized access to critical data. It may also help you meet the regulatory requirements that come with handling financial data, such as credit card numbers; health data, such as patient care records or insurance information; or other kinds of private data, such as social security numbers, addresses, and phone numbers. Once you've set up your key material, you can use Shield Platform Encryption as you normally would to encrypt data at rest in your Salesforce org.

Take Good Care of Your Keys

When you create and store your own key material outside of Salesforce, it's important that you safeguard that key material. Make sure that you have a trustworthy place to archive your key material; never save a tenant secret or data encryption key on a hard drive without a backup.

Sample Script for Generating a BYOK Tenant Secret

We've provided a helper script that may be handy for preparing your tenant secret for installation. It generates a random number as your tenant secret, calculates a SHA256 hash of the secret, and uses the public key from the certificate to encrypt the secret.

Troubleshooting Bring Your Own Key

One or more of these frequently asked questions may help you troubleshoot any problems that arise.

Why Bring Your Own Key?

Bring Your Own Key (BYOK) gives you an extra layer of protection in the event of unauthorized access to critical data. It may also help you meet the regulatory requirements that come with handling financial data, such as credit card numbers; health data, such as patient care records or insurance information; or other kinds of private data, such as social security numbers, addresses, and phone numbers. Once you've set up your key material, you can use Shield Platform Encryption as you normally would to encrypt data at rest in your Salesforce org.

Shield Platform Encryption enables Salesforce administrators to manage the lifecycle of their data encryption keys while protecting these keys from unauthorized access. By controlling the lifecycle of your organization's tenant secrets, you control the lifecycle of the data encryption keys derived from them. Alternatively, you can opt out of key derivation altogether and upload a final data encryption key.

Data encryption keys aren't stored in Salesforce. Instead, they're derived from the master secret and tenant secret on demand whenever a key is needed to encrypt or decrypt customer data. The master secret is generated once per release for everyone by a hardware security module (HSM). The tenant secret is unique to your org, and you control when it is generated, activated, revoked, or destroyed.

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

You have three options for setting up your key material.

- Use the Shield Key Management Service (KMS) to generate your org-specific tenant secret for you.
- Use the infrastructure of your choice, such as an on-premises HSM, to generate and manage your tenant secret outside of Salesforce. Then upload that tenant secret to the Salesforce KMS. This option is popularly known as "Bring Your Own Key," although the element you're really bringing is the tenant secret from which the key is derived.
- Opt out of the Shield KMS key derivation process with the Bring Your Own Key service. Use the infrastructure of your choice to create a data encryption key instead of a tenant secret. Then upload this data encryption key to the Shield KMS. When you opt out of derivation on a key-by-key basis, the Shield KMS bypasses the derivation process and uses this key material as your final data encryption key. You can rotate customer-supplied data encryption keys just like you would rotate a customer-supplied tenant secret.

Take Good Care of Your Keys

When you create and store your own key material outside of Salesforce, it's important that you safeguard that key material. Make sure that you have a trustworthy place to archive your key material; never save a tenant secret or data encryption key on a hard drive without a backup.

Back up all imported key material after you upload them to Salesforce. This ensures that you have copies of your active key material. See Back Up Your Tenant Secret in Salesforce Help.

Review your company policy on key rotation. You can rotate and update your keys on your own schedule. See Rotate Your Encryption Keys.

[1] Important: If you accidentally destroy a tenant secret that isn't backed up, Salesforce won't be able to help you retrieve it.

EDITIONS

Available as an add-on subscription in: Enterprise. Performance, and **Unlimited** Editions. Requires purchasing Salesforce Shield. Available in **Developer** Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

Sample Script for Generating a BYOK Tenant Secret

We've provided a helper script that may be handy for preparing your tenant secret for installation. It generates a random number as your tenant secret, calculates a SHA256 hash of the secret, and uses the public key from the certificate to encrypt the secret.

- 1. Download the script from the Salesforce Knowledge Base. Save it in the same directory as the certificate.
- 2. Run the script specifying the certificate name, like this: ./secretgen.sh my certificate.crt

Replace this certificate name with the actual filename of the certificate you downloaded.

- Tip: If needed, use chmod +w secretgen.sh to make sure you have write permission to the file and use chmod 775 to make it executable.
- 3. The script generates a number of files. Look for the two files that end with the .b64 suffix. The files ending in .b64 are your base 64-encoded encrypted tenant secret and base 64-encoded hash of the plaintext tenant secret. You'll need both of these files for the next step.

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and **Unlimited** Editions. Requires purchasina Salesforce Shield. Available in **Developer** Edition at no charge for orgs created in Summer '15 and later.

Troubleshooting Bring Your Own Key

One or more of these frequently asked questions may help you troubleshoot any problems that arise.

I'm trying to use the script you provide, but it won't run.

Make sure that you are running the right script for your operating system. If you are working on a Windows machine, you can install a Linux emulator and use the Linux script. These issues can also prevent the script from running:

- You don't have write permission in the folder you're trying to run the script from. Try running the script from a folder that you have write permission for.
- The certificate that the script references is missing. Make sure you've properly generated the certificate.
- The certificate is missing or is not being referenced by the correct name. Make sure you've entered the correct file name for your certificate in the script.

I want to use the script you provide, but I also want to use my own random number generator.

The script we provide uses a random number generator to create a random value that is then used as your tenant secret. If you would like to use a different generator, replace head -c 32 /dev/urandom | tr '\n' = (or, in the Mac version, head -c 32 /dev/urandom > \$PLAINTEXT_SECRET) with a command that generates a random number using your preferred generator.

What if I want to use my own hashing process to hash my tenant secret?

No problem. Just make sure that the end result meets these requirements:

- Uses an SHA-256 algorithm.
- Results in a base64 encoded hashed tenant secret.
- Generates the hash of the random number BEFORE encrypting it.

If any of these three criteria aren't met, you won't be able to upload your tenant secret.

How should I encrypt my tenant secret before I upload it to Salesforce?

If you're using the script provided, the encryption process is taken care of. If you do not use the script, specify the OAEP padding scheme when you encrypt your tenant secret. Make sure the resulting encrypted tenant secret and hashed tenant secret files are encoded using base64. If either of these criteria are not met, you won't be able to upload your tenant secret.

If you choose to not use the script provided, follow the instructions in the Generate And Wrap Your Tenant Secret Help topic.

I can't upload my Encrypted tenant secret and Hashed tenant secret.

A handful of errors can prevent your files from uploading. Use the chart to make that sure your tenant secrets and certificates are in order.

Possible cause	Solution
Your files were generated with an expired certificate.	Check the date on your certificate. If it has expired, you can renew your certificate or use another one.
Your certificate is not active, or is not a valid Bring Your Own Key certificate.	Ensure that your certificate settings are compatible with the Bring Your Own Key feature. Under the Certificate and Key Edit section of the Certificates page, select a 4096-bit certificate size, disable Exportable Private Key, and enable Platform Encryption.
You haven't attached both the encrypted tenant secret and the hashed tenant secret.	Make sure that you attach both the encrypted tenant secret and hashed tenant secret. Both of these files should have a .b64 suffix.

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in

Available in both Salesforce Classic and Lightning Experience.

Summer '15 and later.

Possible cause	Solution
Your tenant secret or hashed tenant secret wasn't generated properly.	Several problems can cause this error. Usually, the tenant secret or hashed tenant secret wasn't generated using the correct SSL parameters. If you are using OpenSSL, you can refer to the script for an example of the correct parameters you should use to generate and hash your tenant secret. If you are using a library other than OpenSSL, check that library's support page for help finding the correct parameters to both generate and hash your tenant secret.
	Still stuck? Contact your Salesforce account executive. They'll put you in touch with someone at Salesforce who can help.

I'm still having problems with my key. Who should I talk to?

If you still have questions, contact your account executive. They'll put you in touch with a support team specific to this feature.

Which Standard Fields and Data Elements Can I Encrypt?

You can encrypt certain fields on standard and custom objects, data in Chatter, and search index files. With some exceptions, encrypted fields work normally throughout the Salesforce user interface, business processes, and APIs.

When you encrypt a field, existing values aren't encrypted immediately. Values are encrypted only after they are touched. Contact Salesforce for help encrypting existing data.

Encrypted Standard Fields

You can encrypt the contents of these standard field types.

Accounts

- Account Name
- Account Site
- Billing Address (encrypts Billing Street and Billing City)
- Description
- Fax
- Phone
- Shipping Address (encrypts Shipping Street and Shipping City)
- Website

Note: If your org has enabled Person Accounts, certain account and contact fields are combined into one record. In that case, you can enable encryption for a different set of Account fields.

Accounts (if Person Accounts enabled for your org)

- Account Name
- Account Site
- Assistant
- Assistant Phone
- Billing Address (encrypts Billing Street and Billing City)
- Description

Other Encrypted Fields and Data Elements

Individual

- Name
- Note: The Individual object is available only if you enable the org setting to make data protection details available in records.

Chatter feed

- Feed Comment—Body
- Feed Item—Body
- Feed Item—Title
- Feed Revision—Value

These fields include feed posts, questions and answers, link names, comments, and poll questions. They don't encrypt poll choices.

The revision history of encrypted Chatter fields is also encrypted. If you edit or update an encrypted Chatter field, the old information remains encrypted.

Note: Enabling Encryption for Chatter encrypts all eligible Chatter fields. You can't choose to encrypt only certain Chatter fields.

Search Indexes

When you encrypt search indexes, each file created to store search results is encrypted.

Einstein Analytics

Encrypts new Einstein Analytics datasets.

Note: Data that was in Einstein Analytics before encryption was enabled is not encrypted. If existing data is imported from Salesforce objects through the dataflow, the data becomes encrypted on the next dataflow run. Other existing data (such as CSV data) must be reimported to become encrypted. Although existing data is not encrypted, it is still accessible and fully functional in its unencrypted state when encryption is enabled.

Change Data Capture (Developer Preview)

Change Data Capture (CDC) provides near-real-time changes of Salesforce records and synchronizes corresponding records in an external data store. If a Salesforce record field is encrypted with Shield Platform Encryption, changes to encrypted field values generate change events. You can encrypt these change events by selecting **Encrypt and deliver Change Data Capture events** on the Encryption Policy page in Setup.

Note: Change Data Capture is available as a developer preview in Developer Edition orgs. Change Data Capture isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements.

All commands, parameters, and other features are subject to change or deprecation at any time, with or without notice. Don't

implement functionality developed with these commands or tools. In addition to the developer preview, Change Data Capture continues to be offered through a pilot program to select customers. To be nominated to participate in the pilot program, contact Salesforce. You can provide feedback and suggestions for Change Data Capture in this Trailblazer Community group.

Health Cloud

Note: Health Cloud standard objects and fields are available to users who have the Health Cloud Platform permission set license

SEE ALSO:

Encrypt New Data in Standard Fields

Which Custom Fields Can I Encrypt?

You can encrypt the contents of fields that belong to one of these custom field types, on either standard or custom objects.

- Email
- Phone
- Text
- Text Area
- Text Area (Long)
- Text Area (Rich) (beta)
- URL
- Date
- Date/Time

After a custom field is encrypted, you can't change the field type. For custom phone and email fields, you also can't change the field format.

(1) Important: When you encrypt the Name field, enhanced lookups are automatically enabled. Enhanced lookups improve the user's experience by searching only through records that have been looked up recently, and not all existing records. Switching to enhanced lookups is a one-way change. You can't go back to standard lookups, even if you disable encryption.

You can't use Schema Builder to create an encrypted custom field.

To encrypt custom fields that have the Unique or External ID attribute, you can only use deterministic encryption.

Some custom fields can't be encrypted:

- Fields on external data objects
- Fields that are used in an account contact relation

Note: This page is about Shield Platform Encryption, not Classic Encryption. What's the difference?

SEE ALSO:

Encrypt New Data in Standard Fields

Which Files Are Encrypted?

When you enable Shield Platform Encryption for files and attachments, all files and attachments that can be encrypted are encrypted. The body of each file or attachment is encrypted when it's uploaded.

These kinds of files are encrypted when you enable file encryption:

- Files attached to email
- Files attached to feeds
- Files attached to records
- Images included in Rich Text Area fields
- Files on the Content, Libraries, and Files tabs (Salesforce Files, including file previews, and Salesforce CRM Content files)
- Files managed with Salesforce Files Sync and stored in Salesforce
- Files attached to Chatter posts, comments, and the sidebar
- Notes body text using the new Notes tool
- Files attached to Knowledge articles
- Quote PDFs

These file types and attachments aren't encrypted:

- Chatter group photos
- Chatter profile photos
- Documents
- Notes previews in the new Notes tool
- Notes and Notes previews in the old Notes tool
- Note: This page is about Shield Platform Encryption, not Classic Encryption. What's the difference?

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

Which User Permissions Does Shield Platform Encryption Require?

Assign permissions to your users according to their roles regarding encryption and key management. Some users need permission to select data for encryption, while other users require combinations of permissions to work with certificates or key material. Enable these permissions for user profiles just like you would any other user permission.

	_	Customize Application	View Setup and Canguatan	Manage Certificates	Modify All Data
View Platform Encryption Setup pages		✓	✓		
Edit Encryption Policy page settings	√ (Optional)	<			
Generate, destroy, export, import, and upload tenant secrets and customer-supplied key material	✓				
Query the TenantSecret object via the API	✓				
Edit, upload, and download HSM-protected certificates with the Shield Platform Encryption Bring Your Own Key service	*			✓	
Enable features on the Advanced Settings page		✓			✓

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and **Unlimited** Editions. Requires purchasing Salesforce Shield. Available in **Developer** Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

The Customize Application and Manage Certificates permissions are automatically enabled for users with the System Administrator profile.

Restrict Access to Encryption Policy Settings

You can require admins to also have the Manage Encryption Keys permission to complete encryption policy tasks. These tasks include changing the encryption scheme on fields, enabling and disabling encryption on fields, files, and attachments, and other data elements.

To opt in to this feature, you need the Manage Encryption Keys permission. Then opt in from the Advanced Settings page.

- 1. From Setup, in the Quick Find box, enter Platform Encryption, and then select Advanced Settings.
- 2. Select Restrict Access to Encryption Policy Settings.

This restriction applies to actions taken through the API or from Setup pages, such as the Encryption Policy page or the Object Manager.

Note: This page is about Shield Platform Encryption, not Classic Encryption. What's the difference?

Manage Shield Platform Encryption

Why Isn't My Encrypted Data Masked?

If the encryption service isn't available, data is masked in some types of encrypted fields. This is to help you troubleshoot encryption key issues, not to control user access to data. If you have data that you don't want some users to see, revisit those users' field-level security settings, record access settings, and object permissions.

Encryption prevents outsiders from using your Salesforce data even if they manage to get it. It is not a way to hide data from authenticated users. User permissions are the only way to control data visibility for authenticated users. Encryption at rest is about logins, not permissions.

With Shield Platform Encryption, if a user is authorized to see a given set of data, that user sees that data whether it's encrypted or not.

- Authentication means that making sure only legitimate users can get into your system. For
 example, a company's Salesforce org is only for use by active employees of that company.
 Anyone who is not an employee is not authenticated; that is, they are barred from logging in.
 If they do somehow get their hands on the data, it's useless to them because it is encrypted.
- Authorization defines which data or features an authenticated user can use. For example, a sales associate can see and use data in the Leads object, but can't see the regional forecasts, which are intended for sales managers. Both the associate and the manager are properly logged in (authenticated), but their permissions (authorization) are different. That the data is encrypted doesn't make any difference to them.

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

In general, data can be masked but not encrypted, or encrypted but not masked. For example, regulators often require that only the last four digits of a credit card number be visible to users. Applications typically mask the rest of the number, meaning they replace the digits with asterisks on the user's screen. Without encryption, you can still read the digits that are masked if you can get to the database where they are stored.

Masking might not be enough for your credit card numbers. You may or may not want to encrypt them in the database as well. (You probably should.) If you do, authenticated users will still see the same masked values.

In this way, masking and encryption are different solutions for different problems. You mask data to hide it from users who are authenticated but not authorized to see that data. You encrypt data to prevent someone from stealing the data. (Or, more precisely, to make the data useless if someone does steal it.)

The following table shows the fields that use masking. All others don't.

Field Type	Mask	What It Means
Email, Phone, Text, Text Area, Text Area (Long), URL	??????	This field is encrypted, and the encryption key has been destroyed.
	!!!!!	This service is unavailable right now. For help accessing this service, contact Salesforce.
Custom Date	08/08/1888	This field is encrypted, and the encryption key has been destroyed.
	01/01/1777	This service is unavailable right now. For help accessing this service, contact Salesforce.
Custom Date/Time	08/08/1888 12:00 PM	This field is encrypted, and the encryption key has been destroyed.
	01/01/1777 12:00 PM	This service is unavailable right now. For help accessing this service, contact Salesforce.

You can't enter these masking characters into an encrypted field. For example, if a Date field is encrypted and you enter 07/07/1777, you must enter a different value before it can be saved.

Note: This page is about Shield Platform Encryption, not Classic Encryption. What's the difference?

Behind the Scenes: The Shield Platform Encryption Process

When users submit data, the application server looks for the org-specific data encryption key in its cache. If it isn't there, the application server gets the encrypted tenant secret from the database and asks the key derivation server to derive the key. The encryption service then encrypts the data on the application server.

Salesforce securely generates the master and tenant secrets by using Hardware Security Modules (HSMs). The unique key is derived by using PBKDF2, a Key Derivation Function (KDF), with the master and tenant secrets as inputs.

EDITIONS

Available as an add-on subscription in: **Enterprise**, **Performance**, and **Unlimited** Editions. Requires purchasing Salesforce Shield. Available in **Developer** Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

Shield Platform Encryption Process Flow

- 1. When a Salesforce user saves encrypted data, the runtime engine determines from metadata whether to encrypt the field, file, or attachment before storing it in the database.
- **2.** If so, the encryption service checks for the matching data encryption key in cached memory.
- **3.** The encryption service determines whether the key exists.
 - **a.** If so, the encryption service retrieves the key.

- **b.** If not, the service sends a derivation request to a key derivation server and returns it to the encryption service running on the Salesforce Platform.
- **4.** After retrieving or deriving the key, the encryption service generates a random initialization vector (IV) and encrypts the data using 256-bit AES encryption.
- **5.** The ciphertext is saved in the database or file storage. The IV and corresponding ID of the tenant secret used to derive the data encryption key are saved in the database.

Salesforce generates a new master secret at the start of each release.

Behind the Scenes: The Search Index Encryption Process

The Salesforce search engine is built on the open-source enterprise search platform software Apache Solr. The search index, which stores tokens of record data with links back to the original records stored in the database, is housed within Solr. Partitions divide the search index into segments to allow Salesforce to scale operations. Apache Lucene is used for its core library.

Leveraging Shield Platform Encryption's HSM-based key derivation architecture, metadata, and configurations, Search Index Encryption runs when Shield Platform Encryption is in use. The solution applies strong encryption on an org-specific search index (.fdt, .tim, and .tip file types) using an org-specific AES-256 bit encryption key. The search index is encrypted at the search index segment level, and all search index operations require index blocks to be encrypted in memory.

The only way to access the search index or the key cache is through programmatic APIs.

A Salesforce security administrator can enable Search Index Encryption from Setup. The administrator first creates a tenant secret of the Search Index type, then enables Encryption for Search Indexes. The admin configures their encryption policy by selecting fields and files to encrypt. An org-specific HSM-derived key is derived from the tenant secret on demand. The key material is passed to the search engine's cache on a secure channel.

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

The process when a user creates or edits records:

- 1. The core application determines if the search index segment should be encrypted or not based on metadata.
- 2. If the search index segment should be encrypted, the encryption service checks for the matching search encryption key ID in the cached memory.
- **3.** The encryption service determines if the key exists in the cache.
 - **a.** If the key exists in the cache, the encryption service uses the key for encryption.
 - **b.** Otherwise, the service sends a request to the core application, which in turn sends an authenticated derivation request to a key derivation server and returns the key to the core application server.
- **4.** After retrieving the key, the encryption service generates a random initialization vector (IV) and encrypts the data using NSS or JCE's AES-256 implementation.
- 5. The key ID (identifier of the key being used to encrypt the index segment) and IV are saved in the search index.

The process is similar when a user searches for encrypted data:

- 1. When a user searches for a term, the term is passed to the search index, along with which Salesforce objects to search.
- 2. When the search index executes the search, the encryption service opens the relevant segment of the search index in memory and reads the key ID and IV.
- **3.** Steps 3 through 5 of the process when a user creates or edits records are repeated.
- **4.** The search index processes the search and returns the results to the user seamlessly.

If Salesforce admins disable encryption on a field, all index segments that were encrypted are unencrypted and the key ID is set to null. This process can take up to seven days.

How Do I Deploy Shield Platform Encryption?

When you deploy Shield Platform Encryption to your org with a tool such as Force.com IDE, Migration Tool, or Workbench, the Encrypted field attribute persists. However, if you deploy to orgs with different encryption settings, the effect depends on whether Shield Platform Encryption is enabled in the target org.

Regardless of how you deploy, Salesforce automatically checks to see if the implementation violates Shield Platform Encryption guidelines.

Source Organization	Target Organization	Result
Shield Platform Encryption enabled	Shield Platform Encryption enabled	The source Encrypted field attribute indicates enablement
Shield Platform Encryption enabled	Shield Platform Encryption not enabled	The Encrypted field attribute is ignored
Shield Platform Encryption not enabled	Shield Platform Encryption enabled	The target Encrypted field attribute indicates enablement

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

Note: This page is about Shield Platform Encryption, not Classic Encryption. What's the difference?

How Does Shield Platform Encryption Work In a Sandbox?

Refreshing a sandbox from a production organization creates an exact copy of the production organization. If Shield Platform Encryption is enabled on the production organization, all encryption settings are copied, including tenant secrets created in production.

Once a sandbox is refreshed, tenant secret changes are confined to your current organization. This means that when you rotate or destroy a tenant secret on sandbox, it doesn't affect the production organization.

As a best practice, rotate tenant secrets on sandboxes after a refresh. Rotation ensures that production and sandbox use different tenant secrets. Destroying tenant secrets on a sandbox renders encrypted data unusable in cases of partial or full copies.

Note: This page is about Shield Platform Encryption, not Classic Encryption. What's the difference?

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

Shield Platform Encryption Terminology

Encryption has its own specialized vocabulary. To get the most out of your Shield Platform Encryption features, it's a good idea to familiarize yourself with the key terms, such as hardware security module, key rotation, and master secret.

Data Encryption

The process of applying a cryptographic function to data that results in ciphertext. The platform encryption process uses symmetric key encryption and a 256-bit Advanced Encryption Standard (AES) algorithm using CBC mode, and a randomized, 128-bit initialization vector (IV) to encrypt field-level data and files stored on the Salesforce Platform. Both data encryption and decryption occur on the application servers.

Data Encryption Keys

Shield Platform Encryption uses data encryption keys to encrypt and decrypt data. Data encryption keys are derived on the Shield Key Management Service (KMS) using keying material split between a per-release master secret and an organization-specific tenant secret stored encrypted in the database as a part of your organization. The 256-bit derived keys exist in memory until evicted from the cache.

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

Encrypted Data at Rest

Data that is encrypted when persisted on disk. Salesforce supports encryption for fields stored in the database; documents stored in files, content, libraries, and attachments; search index files; Einstein Analytics datasets; and archived data.

Encryption Key Management

Refers to all aspects of key management, such as key generation, processes, and storage. Tenant secret management is performed by administrators or users who have the "Manage Encryption Keys" permission.

Hardware Security Module (HSM)

Used to provide cryptography processing as well as key management for authentication. Shield Platform Encryption uses HSMs to generate and store secret material and run the function that derives data encryption keys used by the encryption service to encrypt and decrypt data.

Initialization Vector (IV)

A random sequence used with a key to encrypt data.

Shield Key Management Service (KMS)

Generates, wraps, unwraps, derives, and secures key material. When deriving key material, the Shield KMS uses a pseudorandom number generator and input such as a password to derive keys. Shield Platform Encryption uses PBKDF2 (Password-based Key Derivation Function 2) with HMAC-SHA-256.

Key (Tenant Secret) Rotation

The process of generating a new tenant secret and archiving the previously active one. Active tenant secrets are used for both encryption and decryption. Archived ones are used only for decryption until all data has been re-encrypted using the new, active tenant secret.

Master HSM

The master HSM consists of a USB device used to generate secure, random secrets each Salesforce release. The master HSM is "air-gapped" from Salesforce's production network and stored securely in a bank safety deposit box.

Master Secret

Used in conjunction with the tenant secret and key derivation function to generate a derived data encryption key (customers can opt out of key derivation). The master secret is rotated each release by Salesforce and encrypted using the per-release master wrapping key, which is in turn encrypted with the Shield KMS's public key so it can be stored encrypted on the file system. Only HSMs can decrypt it. No Salesforce employees have access to these keys in cleartext.

Master Wrapping Key

A symmetric key is derived and used as a master wrapping key, also known as a key wrapping key, encrypting all the per-release keys and secrets bundle.

Tenant Secret

An organization-specific secret used in conjunction with the master secret and key derivation function to generate a derived data encryption key. When an organization administrator rotates a key, a new tenant secret is generated. To access the tenant secret via the API, refer to the TenantSecret object. *No Salesforce employees have access to these keys in cleartext*.

What's the Difference Between Classic Encryption and Shield Platform Encryption?

With Shield Platform Encryption, you can encrypt a variety of widely used standard fields, along with some custom fields and many kinds of files. Shield Platform Encryption also supports person accounts, cases, search, approval processes, and other key Salesforce features. Classic encryption lets you protect only a special type of custom text field, which you create for that purpose.

Feature	Classic Encryption	Platform Encryption
Pricing	Included in base user license	Additional fee applies
Encryption at Rest	✓	✓
Native Solution (No Hardware or Software Required)	✓	✓
Encryption Algorithm	128-bit Advanced Encryption Standard (AES)	256-bit Advanced Encryption Standard (AES)
HSM-based Key Derivation		✓
Manage Encryption Keys Permission		✓
Generate, Export, Import, and Destroy Keys	✓	✓
PCI-DSS L1 Compliance	✓	✓
Masking	✓	
Mask Types and Characters	✓	
View Encrypted Data Permission Required to Read Encrypted Field Values	✓	
Encrypted Standard Fields		✓
Encrypted Attachments, Files, and Content		✓
Encrypted Custom Fields	Dedicated custom field type, limited to 175 characters	*
Encrypt Existing Fields for Supported Custom Field Types		✓

EDITIONS

Available as an add-on subscription in: **Enterprise**, **Performance**, and **Unlimited** Editions. Requires purchasing Salesforce Shield. Available in **Developer** Edition at no charge for orgs created in Summer '15 and later.

Feature	Classic Encryption	Platform Encryption	
Search (UI, Partial Search, Lookups, Certain SOSL Queries)		✓	
API Access	✓	✓	
Available in Workflow Rules and Workflow Field Updates		✓	
Available in Approval Process Entry Criteria and Approval Step Criteria		*	

Shield Platform Encryption Best Practices

Take the time to identify the most likely threats to your organization. This process helps you distinguish data that needs encryption from data that doesn't, so that you can encrypt only what you need to. Make sure that your tenant secret and keys are backed up, and be careful who you allow to manage your secrets and keys.

1. Define a threat model for your organization.

To identify the threats that are most likely to affect your organization, walk through a formal threat modeling exercise. Use your findings to create a data classification scheme, which can help you decide what data to encrypt.

- 2. Encrypt only where necessary.
 - Not all data is sensitive. Focus on information that requires encryption to meet your regulatory, security, compliance, and privacy requirements. Unnecessarily encrypting data impacts functionality and performance.
 - Evaluate your data classification scheme early and work with stakeholders in security, compliance, and business IT departments to define requirements. Balance business-critical functionality against security and risk measures and challenge your assumptions periodically.
- 3. Create a strategy early for backing up and archiving keys and data.

If your tenant secrets are destroyed, reimport them to access your data. You are solely responsible for making sure that your data and tenant secrets are backed up and stored in a safe place. Salesforce cannot help you with deleted, destroyed, or misplaced tenant secrets.

- 4. Read the Shield Platform Encryption considerations and understand their implications on your organization.
 - Evaluate the impact of the considerations on your business solution and implementation.
 - Test Shield Platform Encryption in a sandbox environment before deploying to a production environment. Encryption policy settings can be deployed using change sets.
 - Before enabling encryption, fix any violations that you uncover. For example, if you reference encrypted fields in a SOQL ORDER BY clause, a violation occurs. Fix the violation by removing references to the encrypted fields.
 - When requesting feature enablement, such as pilot features, give Salesforce Customer Support several days lead time. The time to complete the process varies based on the feature and how your org is configured.
- 5. Analyze and test AppExchange apps before deploying them.
 - If you use an app from the AppExchange, test how it interacts with encrypted data in your organization and evaluate whether its functionality is affected.

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

- If an app interacts with encrypted data that's stored outside of Salesforce, investigate how and where data processing occurs and how information is protected.
- If you suspect Shield Platform Encryption could affect the functionality of an app, ask the provider for help with evaluation. Also discuss any custom solutions that must be compatible with Shield Platform Encryption.
- Apps on the AppExchange that are built exclusively using Lightning Platform inherit Shield Platform Encryption capabilities and limitations.
- **6.** Use out-of-the-box security tools.

Shield Platform Encryption is not a user authentication or authorization tool. To control which users can see which data, use out-of-the-box tools such as field-level security settings, page layout settings, and sharing rules, rather than Shield Platform Encryption.

7. Grant the Manage Encryption Keys user permission to authorized users only.

Users with the Manage Encryption Keys permission can generate, export, import, and destroy organization-specific keys. Monitor the key management activities of these users regularly with the setup audit trail.

8. Synchronize your existing data with your active key material.

Existing field and file data is not automatically encrypted when you turn on Shield Platform Encryption. To encrypt existing field data, update the records associated with the field data. This action triggers encryption for these records so that your existing data is encrypted at rest. To encrypt existing files or get help updating other encrypted data, contact Salesforce. We can encrypt existing file data in the background to ensure data alignment with the latest encryption policy and key material.

When you contact Salesforce support to request the background encryption service, allow at least a week before you need the background encryption completed. The time to complete the process varies based on the volume of data involved. It could take several days.

9. Handle currency and number data with care.

Currency and Number fields can't be encrypted because they could have broad functional consequences across the platform, such as disruptions to roll-up summary reports, report timeframes, and calculations. You can often keep private, sensitive, or regulated data of this variety safe in other encryption-supported field types.

10. Communicate to your users about the impact of encryption.

Before you enable Shield Platform Encryption in a production environment, inform users about how it affects your business solution. For example, share the information described in Shield Platform Encryption considerations, where it's relevant to your business processes.

11. Encrypt your data using the most current key.

When you generate a new tenant secret, any new data is encrypted using this key. However, existing sensitive data remains encrypted using previous keys. In this situation, Salesforce strongly recommends re-encrypting these fields using the latest key. Contact Salesforce for help with re-encrypting your data.

12. Use discretion when granting login as access to users or Salesforce Customer Support.

If you grant login access to a user, and they have field level security access to an encrypted field, that user is able to view encrypted data in that field in plaintext.

If you want Salesforce Customer Support to follow specific processes around asking for or using login as access, you can create special handling instructions. Salesforce Customer Support follows these instructions in situations where login as access may help them resolve your case. To set up these special handling instructions, contact your account executive.

Tradeoffs and Limitations of Shield Platform Encryption

Tradeoffs and Limitations of Shield Platform Encryption

A security solution as powerful as Shield Platform Encryption doesn't come without some tradeoffs. When your data is encrypted, some users may see limitations to some functionality, and a few features aren't available at all. Consider the impact on your users and your overall business solution as you design your encryption strategy.

IN THIS SECTION:

General Shield Platform Encryption Considerations

These considerations apply to all data that you encrypt using Shield Platform Encryption.

Which Salesforce Apps Don't Support Shield Platform Encryption?

Some Salesforce features work as expected when you work with data that's encrypted with Shield Platform Encryption. Others don't.

Considerations for Using Deterministic Encryption

These considerations apply to data encrypted with Data in Salesforce (Deterministic) key material.

Shield Platform Encryption and the Lightning Experience

Shield Platform Encryption works the same way in the Lightning Experience as it does in Salesforce Classic, with a few minor exceptions.

Field Limits with Shield Platform Encryption

Under certain conditions, encrypting a field can impose limits on the values that you store in that field. If you expect users to enter non-ASCII values, such as Chinese, Japanese, or Korean-encoded data, we recommend creating validation rules to enforce these limits.

SEE ALSO:

Shield Platform Encryption Best Practices

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

General Shield Platform Encryption Considerations

These considerations apply to all data that you encrypt using Shield Platform Encryption.

Leads

Lead and Case assignment rules, workflow rules, and validation rules work normally when Lead fields are encrypted. Matching and de-duplication of records during lead import works with deterministically encryption, but not probabilistic encryption. Einstein Lead Scoring is not available.

Apex Lead Conversion works normally, but PL-SQL-based lead conversion is not supported.

Flows and Processes

You can reference encrypted fields in most places in your flows and processes. However, you can't reference encrypted fields in these filtering or sorting contexts.

Tool	Filtering Availability	Sorting Availability
Process Builder	Update Records action	n/a
Cloud Flow Designer	Dynamic Record Choice resource	Dynamic Record Choice resource
	Fast Lookup element	Fast Lookup element
	Record Delete element	Record Lookup element
	Record Lookup element	
	Record Update element	

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

You can store the value from an encrypted field in a variable and operate on that value in your flow's logic. You can also update the value for an encrypted field.

Paused flow interviews can result in data being saved in an unencrypted state. When a flow or process is waiting to resume, the associated flow interview is serialized and saved to the database. The flow interview is serialized and saved when:

- Users pause a flow
- Flows execute a Wait element
- Processes are waiting to execute scheduled actions

If the flow or process loads encrypted fields into a variable during these processes, that data might not be encrypted at rest.

Custom Fields

You can't use encrypted custom fields in criteria-based sharing rules.

Some custom fields can't be encrypted.

- Fields that have the Unique or External ID attributes or include these attributes on previously encrypted custom fields
 (applies only to fields that use the probabilistic encryption scheme)
- Fields on external data objects
- Fields that are used in an account contact relation

You can't use Schema Builder to create an encrypted custom field.

You can't use Shield Platform Encryption with Custom Metadata Types.

SOQL/SOSL

- Encrypted fields that use the probabilistic encryption scheme can't be used with the following SOQL and SOSL clauses and functions:
 - Aggregate functions such as MAX(), MIN(), and COUNT_DISTINCT()
 - WHERE clause
 - GROUP BY clause
 - ORDER BY clause

For information about SOQL and SOSL compatibility with deterministic encryption, see Considerations for Using Deterministic Encryption in Salesforce Help.

- 1 Tip: Consider whether you can replace a WHERE clause in a SOQL query with a FIND query in SOSL.
- When you query encrypted data, invalid strings return an INVALID FIELD error instead of the expected MALFORMED QUERY.

Portals

If a portal is enabled in your organization, you can't encrypt standard fields. Deactivate all customer portals and partner portals to enable encryption on standard fields. (Communities are supported.)

To deactivate a customer portal, go to the Customer Portal Settings page in Setup. To deactivate a partner portal, go to the Partners page in Setup.

Search

If you encrypt fields with a key and then destroy the key, the corresponding search terms remain in the search index. However, you can't decrypt the data associated with the destroyed key.

Accounts, Person Accounts, and Contacts

When Person Accounts are turned on, encrypting any of the following Account fields encrypts the equivalent Contact fields, and vice versa.

- Name
- Description
- Phone
- Fax

When you encrypt any of the following Account or Contact fields, the equivalent fields in Person Accounts are also encrypted.

- Name
- Description
- Mailing Address
- Phone
- Fax
- Mobile
- Home Phone

- Other Phone
- Email

When the Account Name or Contact Name field is encrypted, searching for duplicate accounts or contacts to merge doesn't return any results.

When you encrypt the First Name or Last Name field on a contact, that contact appears in the Calendar Invite lookup only if you haven't filtered by First Name or Last Name.

Email to Salesforce

When the standard Email field is encrypted, the detail page for Contacts, Leads, or Person Accounts doesn't flag invalid email addresses. If you need bounce processing to work as expected, don't encrypt the standard Email field.

Salesforce for Outlook

If you encrypt the same fields that you filter in Salesforce for Outlook data sets, Salesforce for Outlook doesn't sync. To get Salesforce for Outlook to sync again, remove the encrypted fields from your filters in your data sets.

Campaigns

Campaign member search isn't supported when you search by encrypted fields.

Notes

You can encrypt the body text of Notes created with the new Notes tool. However, the Preview file and Notes created with the old Notes tool aren't supported.

Field Audit Trail

Data in a previously archived Field Audit Trail isn't encrypted when you turn on Platform Encryption. For example, say that your org uses Field Audit Trail to define a data history retention policy for an account field, such as the phone number field. When you turn on encryption for that field, new phone number records are encrypted as they are created. Previous updates to the phone number field that are stored in the Account History related list are also encrypted. However, phone number history data that is already archived in the FieldHistoryArchive object is stored without encryption. To encrypt previously archived data, contact Salesforce.

Communities

If you encrypt the Account Name field and you're not using Person Accounts, encryption affects how users' roles are displayed to admins. Normally, a community user's role name is displayed as a combination of their account name and the name of their user profile. When you encrypt the Account Name field, the account ID is displayed instead of the account name.

For example, when the Account Name field is not encrypted, users belonging to the Acme account with the Customer User profile would have a role called Acme Customer User. When Account Name is encrypted (and Person Accounts aren't in use), the role is displayed as something like 001D000000IRt53 Customer User.

Data Import

You can't use the Data Import Wizard to perform matching using master-detail relationships or update records that contain fields that use the probabilistic encryption scheme. You can use it to add new records, however.

Reports, Dashboards, and List Views

- Report charts and dashboard components that display encrypted field values might be cached unencrypted.
- You can't sort records in list views by fields that contain encrypted data.

Encryption for Chatter

When you embed a custom component in your Chatter feed using Rich Publisher Add-Ons, the data related to those add-ons is encoded, but it isn't encrypted with the Shield Platform Encryption service. Unencrypted data in Rich Publisher Add-Ons includes data stored in the Extension ID, Text Representation, Thumbnail URL, Title, Payload, and PayloadVersion fields.

Encryption for Custom Matching Rules Used in Duplicate Management

Custom matching rules can only reference fields encrypted with the deterministic encryption scheme. Probabilistic encryption isn't supported. When you rotate your keys, you must deactivate and then reactivate custom matching rules that reference encrypted fields. If you don't take this step after updating your key material, matching rules don't find all your encrypted data.

Standard matching rules that include fields with Shield Platform Encryption don't detect duplicates. If you encrypt a field included in standard matching rules, deactivate the standard rule.

Service protections ensure that loads are balanced across the system. The matching service searches for match candidates until they find all matches or up to 200 matches. With Shield Platform Encryption, the service search maximum is 100 candidates. With encryption, you could find fewer or no possible duplicate records.

Duplicate jobs aren't supported.

General

- Encrypted fields can't be used in:
 - Criteria-based sharing rules
 - Similar opportunities searches
 - External lookup relationships
 - Filter criteria for data management tools
- Live Agent chat transcripts are not encrypted at rest.
- Web-to-Case is supported, but the Web Company, Web Email, Web Name, and Web Phone fields are not encrypted at rest.

Which Salesforce Apps Don't Support Shield Platform Encryption?

Some Salesforce features work as expected when you work with data that's encrypted with Shield Platform Encryption. Others don't.

These apps don't support data encrypted with Shield Platform Encryption. However, you can enable Shield Platform Encryption for other apps when these apps are in use.

- Connect Offline
- Commerce Cloud
- Data.com
- Einstein Engine
- Heroku (but Heroku Connect does support encrypted data)
- Marketing Cloud (but Marketing Cloud Connect does support encrypted data)
- Pardot (but Pardot Connect supports encrypted contact email addresses if your Pardot org allows multiple prospects with the same email address)
- Salesforce CPQ
- Salesforce IQ
- Social Customer Service
- Thunder
- Quip

Legacy portals (customer, self-service, and partner) don't support data encrypted with Shield Platform Encryption. If legacy portals are active, Shield Platform Encryption can't be enabled.

Note: This page is about Shield Platform Encryption, not Classic Encryption. What's the difference?

Considerations for Using Deterministic Encryption

These considerations apply to data encrypted with Data in Salesforce (Deterministic) key material.

Key Rotation and Filter Availability

To filter and execute queries on fields with unique attributes, new and existing encrypted data must be encrypted with the active Data in Salesforce (Deterministic) key material. See Synchronize Your Data Encryption with the Background Encryption Service for tips on timing and placing your background encryption service request.

Available Fields and Other Data

The deterministic encryption option is available for custom URL, email, phone, text, and text area field types. It isn't available for the following types of data:

- Custom date, date/time, long text area, or description field types
- Chatter
- Files and attachments

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

Filter Operators

In reports and list views, the operators "equals" and "not equal to" are supported with deterministic encryption. Other operators, like "contains," "or "starts with," don't return an exact match and aren't supported.

Case Sensitivity

When you use deterministic encryption, case matters. In reports, list views, and SOQL queries on encrypted fields, the results are case-sensitive. Therefore, a SOQL query against the Contact object, where LastName = 'Jones', returns only Jones, not jones nor JONES. Similarly, when the filter-preserving scheme tests for unicity (uniqueness), each version of "Jones" is unique.

API Options to Identify Filterable Fields

Fields encrypted using the deterministic encryption scheme are filterable. You can use the isFilterable() method to determine the encryption scheme of a particular encrypted field. If the field is filterable, the method returns true.

However, you can't explicitly detect or set the deterministic encryption scheme via the API.

External ID

You can enable the external ID for deterministically encrypted fields when you use the Unique - Case-Sensitive attribute. External ID isn't available for email field types.

Compound Names

Even with deterministic encryption, some kinds of searches don't work when data is encrypted. Concatenated values, such as compound names, aren't the same as the separate values. For example, the ciphertext for the compound name "William Jones" is not the same as the concatenation of the ciphertexts for "William" and "Jones".

So, if the First Name and Last Name fields are encrypted in the Contacts object, this query doesn't work:

```
Select Id from Contact Where Name = 'William Jones'
```

But this query does work:

```
Select Id from Contact Where FirstName = 'William' And LastName = 'Jones'
```

Filter Records by Strings

You can search for records using strings. However, commas in strings act as OR statements. If your string includes a comma, use quotation marks around the string. For example, a search for "Universal Containers, Inc, Berlin" returns records that include the full string including the comma. Searches for Universal Containers, Inc, Berlin returns records that include Universal Containers or Inc or Berlin.

SOQL GROUP BY Statements

You can use most of the SOQL statements with deterministic encryption. One exception is GROUP BY, which isn't supported, even though you can group report results by row or column.

SOQL LIKE and STARTS WITH Statements

Deterministic encryption only supports exact, case-sensitive matches. Comparison operators that return partial matches aren't supported. For example, LIKE and STARTS WITH statements aren't supported.

SOQL ORDER BY Statements

Because deterministic encryption doesn't maintain the sort order of encrypted data in the database, ORDER BY isn't supported.

Indexes

Deterministic encryption supports single-column indexes, single-column case-sensitive unique indexes, two-column indexes, and custom indexes on standard and custom fields.

Shield Platform Encryption and the Lightning Experience

Shield Platform Encryption works the same way in the Lightning Experience as it does in Salesforce Classic, with a few minor exceptions.

Notes

Note previews in Lightning are not encrypted.

File Encryption Icon

The icon that indicates that a file is encrypted doesn't appear in Lightning.

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

Field Limits with Shield Platform Encryption

Under certain conditions, encrypting a field can impose limits on the values that you store in that field. If you expect users to enter non-ASCII values, such as Chinese, Japanese, or Korean-encoded data, we recommend creating validation rules to enforce these limits.

	API Length	Byte Length	Non-ASCII Characters
Assistant Name (Contact)	40	120	22
Address (To, CC, BCC on Email Message) (beta)	3000	4000	2959
City (Account, Contact, Lead)	40	120	22
Email (Contact, Lead)	80	240	70
Fax (Account)	40	120	22
First Name (Account, Contact, Lead)	40	120	22
Last Name (Contact, Lead)	80	240	70
Middle Name (Account, Contact, Lead)	40	120	22
Name (Custom Object) (beta)	80	240	80

EDITIONS

Available as an add-on subscription in: Enterprise, Performance, and Unlimited Editions. Requires purchasing Salesforce Shield. Available in Developer Edition at no charge for orgs created in Summer '15 and later.

	API Length	Byte Length	Non-ASCII Characters
Name (Opportunity)	120	360	110
Phone (Account, Contact)	40	120	22
Site (Account)	80	240	70
Subject (Email Message) (beta)	3000	3000	2207
Title (Contact, Lead)	128	384	126

Note: This list isn't exhaustive. For information about a field not shown here, refer to the API.

Case Comment Object

The Body field on the Case Comment object has a limit of 4,000 ASCII characters (or 4,000 bytes). However, when these fields are encrypted, the character limit is lower. How much lower depends on the kind of characters you enter.

- ASCII: 2959
- Chinese, Japanese, Korean: 1333
- Other non-ASCII: 1479

Note: This page is about Shield Platform Encryption, not Classic Encryption. What's the difference?

SEE ALSO:

Encrypt New Data in Standard Fields
